LIMITATIONS

The services described in this report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, express or implied, is made. These services were performed consistent with our agreement with our client. This report is solely for the use and information of our client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.

Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. We do not warrant the accuracy of information supplied by others, nor the use of segregated portions of this report.

The purpose of a geologic/hydrogeologic study is to reasonably characterize existing site conditions based on the geology/hydrogeology of the area. In performing such a study, it is understood that a balance must be struck between a reasonable inquiry into the site conditions and an exhaustive analysis of each conceivable environmental characteristic. The following paragraphs discuss the assumptions and parameters under which such an opinion is rendered.

No investigation is thorough enough to describe all geologic/ hydrogeologic conditions of interest at a given site. If conditions have not been identified during the study, such a finding should not therefore be construed as a guarantee of the absence of such conditions at the site, but rather as the result of the services performed within the scope, limitations, and cost of the work performed.

We are unable to report on or accurately predict events that may change the site conditions after the described services are performed, whether occurring naturally or caused by external forces. We assume no responsibility for conditions we were not authorized to evaluate, or conditions not generally recognized as predictable when services were performed.

Geologic/hydrogeologic conditions may exist at the site that cannot be identified solely by visual observation. Where subsurface exploratory work was performed, our professional opinions are based in part on interpretation of data from discrete sampling locations that may not represent actual conditions at unsampled locations.

TABLES

Table 1
Description of Monitoring Network
Hydrogeologic and Geotechnical Characterization Workplan
Coffin Butte Landfill

Monitoring Program	Monitored Area	Position
Landfill Water Quality Monitoring Program		
Compliance Wells		
MW-1D, MW-3D, MW-12S, MW-12D	Cell 1	Downgradient
MW-10S, MW-10D, MW-11S, MW-11D	Cell 1A	Downgradient
MW-20, MW-21	Closed Landfill	Downgradient
MW-26, MW-27	Cells 2/3/4/5	Downgradient
Detection Wells		
MW-8S, MW-15	Former Leachate Irrigation Fields A/B	Downgradient
MW-17, MW-18, MW-19	Cells 1/1A	Downgradient
MW-23	Cell 2	Crossgradient
MW-24	Cells 2/3	Crossgradient
P-8	Cell 1	
Phillips	Domestic Water Quality	—
Other Monitoring Well Sites		
MW-9S	East boundary of property	—
Observation Wells/Piezometers		
MW-1S, MW-3S, MW-8D, MW-14S, MW-14D, PW-2, P-8, P-9, P-10, P-19, P-22, P-23 Duplex, Merril, Berkland	Various	—
Wetland Piezometers		
WP-1, WP-3, WP-5, WP-6, WP-8, WP-9	Fields South of Coffin Butte Road	Various
Quarry Piezometers		
QP-3S, QP-4S, QP-5N, QP-6N, QP-7N	Knife River Quarry and Coffin Butte	Various
Secondary Leachate Collection System		
LDS-2B	Cells 2B, 2C	Underneath
LDS-3	Cell 3	Underneath
LDS-4	Cell 4	Underneath
LDS-5	Cell 5	Underneath
LDS-WLP (formerly LDS-SP)	West Leachate Pond	Underneath
LDS-ELP	East Leachate Pond	Underneath
Leachate		
L-1	Cell 1	—
L-2B	Cells 2A, 2B, 2C, 2D	—
L-3	Cell 3	—
L-4	Cell 4	—
L-5	Cell 5	—
L-Pond	Active Leachate Pond (composite of cells)	
Surface Water		
S-1	Background (Soap Creek)	Upstream
S-2, S-4	Cell 1, 1A, Closed Landfill	Downstream
Underdrains		
S-U2 (end of pipe not accessible for sampling)	Cell 2C/D & Cell 4 (north half)	Underneath
S-U3	Cell 3	Underneath
S-U4	East Leachate Pond	Underneath
S-U5	West Leachate Pond	Underneath
S-U6 (typically dry-disharges to ditch)	Cell 4 (south half)	Underneath
S-U7 (Manhole east of cell-not accessible)	Cell 5A	Underneath
Stormwater Monitoring Program (1200Z Permit)		
Outfall (monitored by rock quarry operator)	Quarry/part of Cell 1A & Closed Landfill	Downstream
Outfall 001 (west end of western bioswale)	Cell 1	Downstream
Outfall 002 (northeast end of eastern bioswale)	Cells 2/3/4/5	Downstream

Notes: msl = mean sea level; bgs = below ground surface; OH= open hole; na = not available.
Drilling methods: HSA = hollow stem auger; SSA = solid stem auger

[a] Multiple well completion in single borehole.

[b] Measuring point is 0.02' higher than surveyed reference elevation shown due to installation of bladder pump enclosure. Groundwater elevations calculated from corrected elevation.

[c] Ground level and casing elevation were raised in June 1996 as part of regrading for truck scale. Wells and ground level elevation were resurveyed by Darryl Harms of Corvallis, OR.

[d] Estimated 20 feet higher than original elevation (added two 10-foot long pieces of 2-inch PVC pipe in 8/12/99 and 10/12/99). Well completion depths relative to original ground surface.

Notes:

[a] negative number indicates liner above current ground level, boring in area of fill.

All measurements in feet

BGL: below ground level

GL: current ground level

Borings in fill, assume boring depth of 25 ft.

Borings in cut, depth is 20 feet below base of liner

REMARKS

Exploratory boring B-14 drilled by 8-inch dia. hollow stem auger from 0-9.7 feet; continuously diamond cored from 9.7-70 feet. Boring backfilled with cement-bentonite grout. Monitoring well boring MW-14D drilled approx. 10 feet east of B-14 by air rotary with 6-inch downhole hammer from surface to 75 feet.

OREGON DEQ APPROVAL OF WORK PLAN

From: SADOFSKY Seth * DEQ <seth.sadofsky@deq.state.or.us>
Sent: Monday, August 9, 2021 3:56 PM
To: Eric Tuppan <eric@tuppanconsultants.com>; GAO Hugh * DEQ <hugh.gao@deq.state.or.us>
Subject: RE: Coffin Butte Expansion Area workplan

Hi Eric,
DEQ agrees with and approves this work plan for site characterization.
I'm out the rest of this week, but let me know when you get the field work scheduled and I will try and get out there.

Subject: Coffin Butte Expansion Area workplan

Seth,

Just checking in to see where you/DEQ is with review of the workplan. At the moment, we are tentatively scheduled for starting the test pits on August 16 for several days and then the borings will begin after Labor Day.

Hope you're doing well.

Eric

Re: Coffin Butte Landfill Expansion Project
Benton County, Oregon
Cultural Resource Survey and Archaeological Testing and Evaluation
AINW Report No. 5127

Archaeological Investigations Northwest, Inc. (AINW), has conducted a cultural resource survey and archaeological testing and evaluation of 85 acres on behalf of Valley Landfills, Inc., for proposed landfill expansion. The Coffin Butte Landfill Expansion project study involved background review, pedestrian survey, excavation of 76 shovel tests, and excavation of five quarter test units. The survey was conducted to comply with the Oregon State Historic Preservation Office (SHPO) standards, with Benton County land use conditions, and with Section 106, as amended, for the portion of the project that will be subject to review by the U.S. Army Corps of Engineers. A portion of the archaeological shovel testing and all of the quarter test unit excavations were conducted under SHPO permit AP-3341.

As a result of the survey, AINW identified and recorded twelve archaeological resources.

- The project area does not overlap any recorded elements of the former 1941 Camp Adair/Adair Air Force Station, and no archaeological deposits pertaining to the Camp Adair site were encountered. No historic-period buildings or structures are within the project area.
- There are eight pre-contact (Native American) isolates consisting of between one and nine artifacts.
- There are two multi-component isolates with both historic-period and pre-contact artifacts. The sparse historic-age artifacts are from casual debris disposal, as well as from municipal compost spread in portions of the project area.
- There are two pre-contact archaeological sites composed primarily of stone fragments that were left behind when Native people made stone tools.

AINW excavated quarter test units at the two archaeological sites to evaluate their significance and integrity. The archaeological findings suggest that the area was used as long as 3,000 years ago by Native people, for making stone tools and possibly for plant gathering.

Project Recommendations

AINW recommends a finding of No Adverse Effect on Historic Properties as long as conditions are met.

- AINW recommends that the 10 isolates identified during survey are not eligible for listing in the National Register of Historic Places (NRHP), and no further work is needed at those locations.
- AINW's excavations found that one of the archaeological sites is disturbed and lacks integrity, and AINW recommends that it is not eligible for listing in the NRHP. Inadvertent discoveries are likely at this location, and AINW recommends construction monitoring to the depth of the archaeological deposit, which is up to 20 inches (in) below the surface.
- AINW's excavations found that the other archaeological site is disturbed to a depth of 12 in, below which are artifacts in intact soil. The portion of the archaeological site below 12 in is eligible for listing in the NRHP due to its potential to retain important information about the past. AINW recommends that the project avoid grading below a depth of 12 in below the surface at this location. AINW recommends monitoring of organic topsoil grading at this location to the depth of project impacts, which is anticipated to a depth of 12 in below the current surface.
- AINW recommends that a monitoring plan and Inadvertent Discovery Plan be developed for the project.
- AINW recommends that graded archaeological soils not be taken offsite for disposal, to avoid creation of a new archaeological deposit at another location.

LEACHATE MANAGEMENT SUMMARY
March 2024
Updated January 15, 2025

Leachate is a liquid generated when water comes into contact with waste placed in a landfill. Leachate flows down though the waste and is collected in a series of drainage layers and piping installed within the landfill as part of the lining system.

The proposed expansion area will not be open to waste placement at the same time that the existing landfill is accepting waste. When the expansion area is open, the leachate generation from waste disposal operations will most likely be less as it is smaller in size than the existing landfill area. Leachate generation from the existing landfill will decrease as waste placement operations cease. Furthermore, detailed calculations regarding leachate generation will be developed and submitted to the Oregon Department of Environmental Quality (ODEQ) during the solid waste permitting process.

When Coffin Butte Landfill (CBL) is ready to construct the expansion area, the new leachate storage ponds will be constructed and new leachate discharge piping will be installed and connected to the existing piping on the north side of Coffin Butte Road. Once the new leachate storage ponds are installed and operating correctly, the existing leachate ponds will be decommissioned and removed. Decommissioning might include, but will not be limited too, the removal of some sediments that would be disposed of in the existing landfill and the liner system will be removed and disposed of in the existing landfill. The design details for this will be submitted to the ODEQ during the solid waste permitting process.

Currently, 50% of the leachate is disposed of at the City of Corvallis wastewater treatment plant and the permit for that operation expires December 31, 2025. The remaining 50% is disposed of at the City of Salem wastewater treatment plant and the permit for that operation expires December 31, 2027.

At CBL, leachate is collected in the leachate collection sumps and is pumped via pipelines to the existing leachate storage ponds. CBL has an agreement with the Corvallis wastewater treatment plant (CWWTP) to dispose of its leachate at their plant. CBL also has an agreement with the City of Salem wastewater treatment plant (SWWTP) to dispose of its leachate at their plant.

CBL is focused on minimizing water entering the landfill and thus reducing leachate generation. CBL uses multiple methodologies to minimize inflow:

- Grading of landfill surfaces to promote runoff and minimize water entering the landfill;
- Grading areas surrounding the landfill to divert water before it enters the landfill;
- Installation of a synthetic covers over areas of the landfill to significantly reduce infiltration of stormwater into the landfill. The synthetic covers are held in place using both anchor trenches and a sand bag/rope ballast system.

Stormwater runoff at the facility is captured in multiple on-site stormwater management ponds.

The current methodology of filling areas in the landfill to grade, covering with soil (for short term inactive areas) or synthetic covers (for longer term inactive areas) will continue with the new cell. In addition, CBL

will formally close portions of the existing Coffin Butte Landfill that have reached final approved grades. By installing the ODEQ approved final cover system, stormwater infiltration will be negligible in those areas. In the short term, the leachate quantity will increase slightly with the additional liner system installed. However, CBL is currently evaluating potential closure activities on portions of the landfill and that will reduce the leachate quantity. Furthermore, as CBL continues to add final cover materials over the older parts of the landfill the leachate generation will continue to decrease.

Leachate from the new cell will be managed using similar collection systems (drainage layers and piping) as now implemented in the existing landfill. Leachate will be pumped to and stored in the new leachate storage ponds. The leachate will be transported by tanker truck to the CWWTP or SWWTP. It should be noted that CBL is limited to the amount of leachate that can be transported to the CWWTP and once that amount is reached, the remaining amount of leachate is transported to the SWWTP. Furthermore, if the CWWTP is phased out, the leachate will be transported to the SWWTP or other approved facility. Applicant must and will comply with all EPA and ODEQ regulations related to leachate management.

The US Environmental Protection Agency (EPA) defines hazardous waste as a waste with properties that make it dangerous or capable of having a harmful effect on human health or the environment. The leachate produced by CBL is not a hazardous waste since the landfill does not accept hazardous waste and the leachate does not meet either of the two criteria used to classify a hazardous waste. A waste is determined to be a listed hazardous waste if it is specifically listed on one of four lists, the F, K, P and U lists found in Title 40 of the Code of Federal Regulations (CFR) part 261. Municipal Solid Waste (MSW) leachate is not found on any of the four lists. Since MSW leachate is not found on any of the four lists, it would not have to be characterized as a listed hazardous waste.

Currently, CBL does not test their leachate for the PFAS contaminates as they are currently not regulated by State of Oregon or the US EPA. However, once the State of Oregon and the US EPA establish the requirements for testing and reporting of the PFAS contaminates then CBL will comply with those requirements.

The federal regulation 40 CFR 261.24 defines the toxicity levels of characteristic hazardous waste. It specifies the test method and the contaminate levels that determine if a waste is toxic. Table 1 is the Maximum Concentration of Contaminates for the Toxicity Characteristic, from 40 CFR 261.24. If the leachate from CBL contains any of the contaminates listed in Table 1 at the concentration equal to or greater than the respective value given in Table 1, then it becomes a characteristic hazardous waste. The column titled VLF.L1 are the actual results from leachate sampled from the existing leachate storage pond dated August 30, 2023. As you can see, the results show that the leachate is not hazardous as none of the contaminates tested equaled or exceeded the regulatory level as shown in Table 1.

EXPIRES: 06/30/2026

Civil & Environmental Consultants, Inc.

D043	Vinyl chloride	0.2	ND

VLF.L1 = Analytical test results from sampling leachate on August 29, 2023

ND = Non Detect

* Hazardous Waste Number

** Quantitation limit is greater than the calculated regulatory level. The quantitation limit therefore becomes the regulatory level.

EXHIBIT 28
REPUBLIC SERVICES LETTER TO THE BENTON COUNTY BOARD OF COMMISSIONERS REGARDING METHANE EMISSIONS

REPUBLIC SERVICES

Sustainability in Action

To: Benton County Board of Commissioners

Date: 2/23/2024

Re: Follow-up to Methane Emissions Discussion

Dear Commissioners & Staff,

Thank you for the opportunity to provide additional insights about methane emissions and differing perspectives at Coffin Butte Landfill, which was part of a broader discussion during the February 6 Board meeting. Also, please know that we heard your stated preference for timely communication and more transparency on substantive matters at Coffin Butte going forward. We are more than pleased to keep you updated and look forward to working with County Staff on both the details and process for future communications.

First, I respectfully offer these important facts about methane management at the Landfill:

- Coffin Butte has 3X more gas collection wells in operation today than industry best practices (typically 1 gas well per acre);
- We have invested more than $7m to upgrade and expand the gas collection system (57 new wells and 22k feet of piping) since 2019, which also exceeds industry standards;
- We are continually optimizing the gas collection system and plan to invest an additional $1.5m to add 14 new gas collection wells and 4,500 feet of piping this year;
- Our site team and consultants utilize a comprehensive maintenance regime, ensuring consistent and highly reliable system performance; and
- The PRC (Pacific Region Compost) is a nationally recognized diversion facility, processing 140k tons of organics annually, which has a direct correlation to methane emissions reductions locally.

In addition, you have a long-standing partner in Republic Services, and we are leading the industry in sustainability action. I am proud to share that we are the first U.S. environmental services provider with an emissions reduction goal approved by the Science Based Targets initiative. In addition, we have set an ambitious goal to reduce our absolute Scope 1 and Scope 2 greenhouse emissions by 35 percent by 2030. Finally, we are an active participant in methane policy conversations at federal and state levels as well as with industry peers and environmental NGOs, with the goal of helping stakeholders find common understandings, share best practices, address differing perspectives, and identify solutions. We are proud to be putting sustainability into action and believe our leadership in this area directly benefits the customers and communities we serve nationwide, to include here in Benton County.

During our February 6 discussion, you asked for more explanation on the EPA's June 2022 inspection and subsequent report on methane exceedances at Coffin Butte, as well as the differing perspectives on that inspection and methane modeling in general. These topics are further addressed below.

REPUBLIC SERVICES

Sustainability in Action

June 2022 EPA Inspection

This one-day inspection was not unique to Coffin Butte, but rather similar in nature to other EPA methane inspections in recent years at landfills across the country. What was unique about our experience, however, is that the inspection occurred during a planned landfill gas collection enhancement project, which is reflective of the major investments outlined above.

At the time of the inspection, Coffin Butte was in the early stages of a weeks-long construction project to install six new vertical collection wells and nine new horizontal collection wells. While one primary purpose of those enhancements was to increase the amount of methane and other biogas captured on site, the work itself involved activities that temporarily increased surface exceedances, such as trench digging.

The EPA inspector did ask if the landfill's gas collection system was operational and running normally, and our engineers responded it was. However, it is also true that at various times during the construction, the overall efficiency and capacity of the gas collection was impacted by the site team needing to turn down the vacuum in certain collection wells, not to mention adjusting landfill cover layers and digging through locations where waste had been disposed.

In many respects, surface exceedances of the type documented by EPA during their inspection would be expected, given the work necessary to make these gas collection system enhancements.

That aside, it is important to note that EPA uses a different investigative practice for identifying landfill emissions. And this correlates directly to the differences you commented on during our February 6 discussion.

Typically, a landfill operator will employ specially trained consultants to conduct regular "surface monitoring" along a consistent pathway to determine, locate, and remediate any points where methane exceeds 500 parts per million. Under EPA protocols, the monitoring device is to be held five to 10 centimeters above ground. The data from these routine practices are submitted to regulators as part of regular reporting.

In general, and at Coffin Butte during their June 2022 inspection, the EPA's environmental technicians take a different approach. They do not walk a consistent pathway, but rather seek out individual points with potential exceedances, probing into cracks, moving rocks, or lifting tarps and cover. In addition, inspectors do not consistently hold their measuring probe at the prescribed height of five to 10 centimeters above ground.

Another salient point about the June 2022 inspection is that the Coffin Butte team was not provided details from EPA technicians with respect to the calibration of equipment used. Typical regulator best practices involve calibrating equipment onsite, following specific protocols. Unfortunately, that did not happen in this case; instead, the inspector calibrated the equipment before arriving at the Landfill.

Ultimately, the EPA reported that their technicians documented 61 exceedances of 500 parts per million, and 21 of those were considered in their estimation to be more significant in scope.

REPUBLIC SERVICES

Sustainability in Action

Finally, it is appropriate to state that we believe that regulations, in general, and inspections of this nature, are important and necessary for all. We respect the EPA and its oversight role, and we collaborate with regulators at all levels whenever appropriate and possible. With respect to the June 2022 inspection, Coffin Butte responded to EPA's findings with corrective actions that included completing the ongoing gas collection enhancement project and adjusting soil cover. To the best of our knowledge, the EPA remains satisfied with those corrective actions and to date no notices of violation have been issued.

Differing Perspectives

Without question, the topic of landfill emissions is one of the more poignant issues in climate conversations today, involving not just landfill operators and regulators, but environmental NGOs and communities large and small nationwide. Beyond the differences in measurement practices noted above, one issue that continues to be debated is how best to model and quantify emissions.

For example, there is considerable discussion among stakeholders about the role of satellite and drone technology in comparison with the more traditional practices involving handheld probing devices. For our part, we have worked (and expect to continue to work) with NGOs and regulators on the application of various advanced technologies, to include fly-over technologies.

While there is a lot of promise with such technologies, there is also ongoing debate about the true accuracy of point in time data captured at dynamic operating environments like municipal solid waste landfills. That's because emissions can fluctuate considerably, often over the course of a day. This can occur for a variety of reasons, including the age and type of waste deposited at the landfill, cover and soil make-up, weather conditions, and the efficiency of a site's gas collection system.

Further, these variables have spurred another policy discussion among stakeholders – what is the appropriate way to model and determine a site's actual, consistent emissions levels if using point in time data collection.

We are optimistic that one day there will be more alignment among the many stakeholders on these issues, as well as continued technological advancements. But for now, please know that the issues you raise are not unique to Benton County. And, if anything, we hope that you will appreciate the fact that Coffin Butte has been proactive in emissions management and reductions and in many respects is a model for industry best practices.

I trust this provides you with the information you were seeking. But, as always, please do not hesitate to contact us with additional questions.

Sincerely,

Ginger Rough
Sr. Manager for Public Affairs

Re: Methane Memo Addendum

Dear Director Schuetz:

As you're aware, Coffin Butte Landfill was inspected by the Environmental Protection Agency in June of 2022. During that inspection, the agency noted 61 exceedances during its surface emissions monitoring for methane.

Benton County's consultant, Maul Foster Alongi, requested that Coffin Butte Landfill provide additional information about how ongoing improvements to the Landfill's gas collection system may have impacted the methane emissions monitoring. Specifically, Maul Foster asked if we could provide detailed information about which of the 61 exceedances were in the construction zone.

During the 2022 inspection, DEQ walked two separate "loops" – one on the western side of the landfill, and a broader, wider loop that encompassed the eastern border and central sections of the landfill.

After the inspection and during a meeting with DEQ, Republic Services' personnel noted that the construction work would have impacted the areas that included flags #48 through #58.

Further review of that area, which includes wells 3V74, 2H86, and 2H94 in the central part of the landfill, indicates that there were at least 22 exceedance points in the general vicinity, or about 36 percent of the total.

It is important to note that during GCCS construction, portions of the system outside of the construction area can be temporarily impacted. This typically occurs when we have to isolate portions of landfill gas header and lateral piping to allow tie-ins and commissioning of new vertical and horizontal gas extraction wells.

As noted in our attached memo to Benton County, Republic Services took immediate corrective action following the 2022 EPA inspection, including adding cover soil and additional soil around the edges of tarps.

We also strengthened seals around the gas collection piping and completed work on an expansion of the Landfill's gas collection and control system, adding 6 new vertical wells and 9 horizontal well collectors.

In June 2024, Coffin Butte was the subject of a no-notice inspection by the EPA. Once again, inspectors conducted surface emissions monitoring at the landfill. While we have not received a formal report from the EPA, at the time of the June 2024 emissions monitoring, EPA inspectors said Coffin Butte was not the subject of an enforcement action. In addition, the landfill has made additional improvements since the inspection, including patching tears in the cover tarps and, once again, expanding the Landfill's gas collection and control system.

At this time, we have not received notification from the EPA that our corrective actions were insufficient, nor have we received notification from the agency that Coffin Butte is the subject of any pending enforcement action.

We continue to invest in the gas collection and control system and have another $1 million enhancement project scheduled for later this year. That project will add 14 new vertical wells, seven new horizontal wells and approximately 12,000 new feet of header, force, and air lines.

Meanwhile, Coffin Butte continues to partner with PNGC power to generate electricity from gas produced at the site – enough to power 4,000 homes. Discussions with PNGC to draw additional gas from the Landfill are ongoing.

Coffin Butte has also updated its flare system, installing a closed flare in October, to comply with DEQ's latest regulations.

Respectfully submitted,

Ginger D. Richardson
Director, Public Affairs
Republic Services

EXHIBIT 29
REPUBLIC SERVICES LETTER TO THE BENTON COUNTY BOARD OF COMMISSIONERS RELATING TO ARSENIC

REPUBLIC SERVICES

Sustainability in Action

To: Benton County Commissioners

Date: 2/15/2024

Dear Commissioner Augerot,

During Republic Services' annual report presentation on Feb. 6, you asked that we follow up with you on three topics. In this email, I'd like to address your questions regarding arsenic levels in the monitoring wells at Coffin Butte Landfill. Thank you for giving me the time and opportunity to come back to you with additional information.

We noted in our landfill annual report (page 9) that "the primary drinking water standard for arsenic was exceeded" at the compliance boundary for Cells 4 and 5 on the landfill's east side, but that these "concentrations represent natural background conditions."

This week, we asked our Coffin Butte Landfill consultant, Eric Tuppan, for additional detail. Tuppan, a registered geologist, and owner/operator of Tuppan Consultants, LLC., has 40 years of industry experience. He founded his Oregon-based geology, hydrogeology, and environmental consulting firm consulting firm in 2003.

In summary:

- The presence of arsenic in soil and rock in Oregon has been documented by the Oregon Department of Environmental Quality with background concentrations specific to geographic regions.
- In the Portland Basin, the background concentration is 8.8 milligrams per kilogram; in the Cascade Range it is 19 milligrams per kilogram; and in the South Willamette Valley (where Coffin Butte is located) it is 18 milligrams per kilogram.
- Arsenic has been detected in three areas of the landfill since sampling first began in 1991. These are described in the text that follows.
- There is no data to suggest that the existing arsenic levels are anything other than what is naturally occurring in the soil, or that leachate is impacting the environment or public health.

As you noted during the Feb. 6 meeting, there was a seepage event that occurred at the Landfill in the 1990s. Valley Landfills Inc. (VLI) discovered this issue in 1994, after groundwater monitoring samples in well MW-23, located on the south side of Cell 2, showed elevated levels of arsenic.

At the time of the investigation, VLI determined that increased concentrations of arsenic, chloride, sodium, and bicarbonate were due to leachate seeping from the south slope of Cell 2. Corrective measures, including excavating the south slope of the landfill and installing a gravel drain, fixed the issue and allowed groundwater quality to recover over time.

REPUBLIC SERVICES

Sustainability in Action

The groundwater sampling referenced in our 2022 annual report was taken from two wells on the eastern side of the landfill, more than 1,000 feet away from the well that's located south of Cell 2.

These two compliance wells, which were installed in 2011, have had stable arsenic readings for the past 20 years, averaging 14.2 micrograms per liter at one site, and 13.3 micrograms per liter for the other.

Both these averages are consistent with the background concentrations of arsenic in the Willamette Valley, as documented by the Department of Environmental Quality. The steady readings over time indicate there have been no leachate releases or impacts on groundwater at these locations.

Arsenic testing at Coffin Butte initially began in April 1991, in well MW-S9 on the landfill's northeast side. This third location has historically had higher concentrations of arsenic, ranging from 27 to 41.8 micrograms per liter over the past 30 years.

However, it is important to note that the initial sampling at this well – which established baseline arsenic levels in background concentrations - occurred prior to the completion of Cell 2 construction or any landfilling on the east side of Coffin Butte.

Because this well is more than 1,800 feet away from MW-23, and because sampling occurred prior to the construction of Cell 2, it is implausible for the readings at this location to have been impacted by leachate.

Coffin Butte conducts groundwater sampling twice a year, in April and October, in a set number of locations as outlined in our DEQ-approved Environmental Monitoring Plan. That plan also specifies the frequency of testing at each well. The most recent sampling at well MW-S9 occurred in 2019 in collaboration with DEQ; it is set to be tested again later this year.

As noted in our 2022 annual report, the Landfill was inspected seven times by a variety of agencies, including the EPA, DEQ's Division of Material Management, DEQ's Division of Air Quality and the cities of Corvallis and Salem. In addition, we submitted annual, semi-annual, quarterly, and monthly reports to federal, state, and local regulators. Coffin Butte remains in compliance with all our permits and regulatory requirements.

I hope this email provides you with the information you requested. Should you have any follow-up questions, please don't hesitate to contact me directly at grough@republicservices.com.

Thank you,
Ginger Rough, Sr. Manager for Public Affairs

To: Petra Schuetz, Benton County Community Development Department

Re: Arsenic Memo Addendum

Dear Director Schuetz:

Benton County's consultant, Maul Foster Alongi, requested that Coffin Butte Landfill consider sharing the most recent findings available as it relates to arsenic levels in groundwater monitoring well "MW-59."

We believe this to be a typographical error and that Maul Foster Alongi is requesting information about well MW-9S. This well has been subject to a quintennial sampling schedule (every 5 years) since 1991, as set by the Oregon Department of Environmental Quality.

Groundwater monitoring well MW-9S is located on the landfill's northeast side and has historically had arsenic readings above what is considered the normally occurring "background concentrations" typically found in this geographic region.

Arsenic concentrations in groundwater well MW-9S have ranged from 27 to 41.8 micrograms per liter over the past 30 years. Natural background concentrations for arsenic in the South Willamette Valle (where Coffin Butte is located) is 18 milligrams per kilogram.*

Coffin Butte Landfill conducts groundwater sampling twice a year, in April and October. As part DEQ's split-sampling, well MW-9S was sampled in October 2024. These samples were sent to a third-party laboratory for statistical analysis and it was determined that arsenic concentrations were at 27 micrograms per liter, which is consistent with previous years. The results will be submitted to ODEQ in March as part of our state-required Annual Environmental Monitoring Report (AEMR.)

Well MW-9S was previously sampled in 2019.

**As noted in the attached arsenic memo, dated February 13, 2024.*

Respectfully submitted,

Ginger D. Richardson
Director, Public Affairs
Republic Services

EXHIBIT 30
PROPOSED COFFIN BUTTE LANDFILL SEISMIC DESIGN

MEMORANDUM

To: Ian Macnab – Republic Services, Inc. (Republic)

From: Timothy D. Mitchell, P.E. – Civil & Environmental Consultants, Inc. (CEC)
Jeff Shepherd, P.E. – CEC

Date: July 9, 2024

Subject: Seismic Design
Coffin Butte Landfill
Corvallis, Benton County, Oregon
Republic Services
CEC Project 322-142

The purpose of this memorandum (memo) is to address the engineering scope regarding slope stability and earthquake response for the newly proposed cell at the Coffin Butte Landfill operated by Republic. CEC understands that the Benton County Neighborhood Tour posed questions relative to the impact of an earthquake and the performance of the various landfill systems (liner, methane capture, etc.) during potential seismic events. This memo intends to explain the process for considering earthquakes and seismicity during the design of a municipal solid waste landfill.

The criteria for the design of a solid waste landfill is described in a document by the United States Environmental Protection Agency (USEPA) in Title 40 CFR Part 258 (Seismic Design Guidance for Municipal Solid Waste Landfill Activities). Oregon has codified its implementation of these rules under the Oregon Administrative Rules (OAR), specifically OAR 340-094. CEC will design the proposed landfill cell to meet the regulatory requirements for seismic impact zones and for potential seismic events as described in the rules.

The code requires that landfill containment structures, including liners, leachate collection systems, and surface water control systems are designed to resist the maximum horizontal acceleration in rock at the site. In addition to the waste itself, the landfill design for this project will take into account the performance of the liner system and leachate collection system in response to seismic loads. This was one point of concern from the neighborhood tour summary letter.

CEC will work closely with Republic and regulators to develop appropriate earthquake and seismic models for use in the design of the landfill cell. According to the USGS, the seismic probability map can be used as a basis to obtain site specific seismic parameters for design. This method provides a high degree of protection to the environment against earthquakes reasonably expected over the life and post-closure maintenance period of the landfill.

The code also requires that the landfill or expansions to the landfill not be located within 200 feet of a fault that has had displacement in Holocene time (11,700 years ago). There are no known faults that have had displacement within 200 feet of the landfill.

In regards to general slope stability considerations, the static and seismic stability will be checked in detail for acceptable factors of safety for the proposed expansion. The stability calculations will consider the geometry of the landfill, the proposed liner system, the anticipated leachate, and leachate drainage. The steepest outer slope allowed by state regulation is 3 Horizontal:1 Vertical (3H:1V).

In summary, CEC will work with Republic to develop a thorough landfill design that addresses possible seismic implications in accordance with applicable codes and requirements and in conjunction with the appropriate regulators.

M-322142.Jul9/P

FARM LEASE

THIS FARM LEASE ("Lease"), made and entered into as of the 15th day of January, 2020 (the "Effective Date"), by and between **VALLEY LANDFILLS, INC.**, an Oregon corporation ("Landlord"), and **AGRI-INDUSTRIES, INC.**, an Oregon corporation ("Tenant").

WITNESSETH:

WHEREAS, the Landlord is the owner of certain real estate located in the City of Corvallis, Benton County, Oregon, more particularly described on Exhibit A attached hereto and incorporated herein (the "Land"); and

WHEREAS, Landlord operates a solid waste disposal landfill on the Land which is known as the Coffin Butte Landfill (the "Landfill"); and

WHEREAS, the Landlord desires to lease to Tenant a portion of the Land consisting of approximately 80 acres, as generally shown on Exhibit A attached hereto and incorporated herein, (the "Premises") in accordance with the terms and provisions of this Lease; and

WHEREAS, Tenant desires to lease from Landlord the Premises, in accordance with the terms and provisions of this Lease; and

WHEREAS, Landlord and Tenant are parties to that certain Compost Processing Agreement dated as of the Effective Date (the "Compost Agreement").

NOW, THEREFORE, in consideration of the mutual covenants and conditions hereinafter set forth, the parties agree as follows:

1. **Lease and Term.** (a) The Landlord leases to the Tenant and the Tenant leases from the Landlord the Premises for a term commencing on the Effective Date and terminating on the earlier to occur of (1) September 30, 2030, or (2) the expiration or earlier termination of the Compost Agreement (the "Term") commencing on the Effective Date. The Term of this Lease may be extended upon the mutual written agreement of Landlord and Tenant. In the event Tenant desires to extend the Term of this Lease, Tenant shall provide Landlord with prior written notice at least 60 days prior to the expiration of the Term.

(b) Notwithstanding anything to the contrary set forth herein, in the event that Landlord determines in its sole discretion that all or any portion of the Premises is needed in connection with the use or development of the Landfill, Landlord shall have the right to terminate this Lease with respect to all or any portion of the Premises upon 30 days prior written notice to Tenant. In the event of a termination of this Lease by Landlord in accordance with this Section, Tenant shall not be required to surrender possession of the Premises to Landlord until after the harvesting of any crops which were planted on the Premises prior to the date of Landlord's notice of termination to Tenant.

2. **Rent; Use.** (a) Landlord acknowledges that the amounts paid by Tenant pursuant to the Compost Agreement include the rent for the Term of this Lease, provided, however, that all costs of maintenance, repairs, utilities, insurance and any and all other expenses necessary in connection with the operation or maintenance of the Premises by Tenant will be paid solely by Tenant during the Term of this Lease, except as expressly set forth herein.

(b) Tenant shall use the Premises solely for the purpose of growing crops, and for no other use or purpose without the prior written consent of the Landlord, which may be withheld in Landlord's sole discretion.

3. Tenant's Duties. The Tenant shall till the Premises in a good and husbandlike manner, consistent with sound agricultural practices. The Tenant shall maintain at all times liability insurance with limits of not less than $1,000,000.00 for injuries to one person in each accident and not less than $1,000,000.00 for injuries to more than one person in each accident and $500,000.00 property damage. The liability insurance shall name the Landlord as an additional insured and the Tenant shall provide to the Landlord a certificate of insurance evidencing that this requirement has been met, on or before the Effective Date. Such policy shall provide that it shall not be amended or terminated without providing Landlord with 30 days advance written notice.

4. Taxes and Maintenance. (a) Landlord shall pay, as the same shall become due and payable, all taxes, assessments and charges of any kind whatsoever accruing during the Term that may at any time be levied or assessed against or with respect to the Premises. Tenant shall be solely responsible for the payment of any taxes, assessments or charges of any kind whatsoever accruing during the Term that may at any time be levied or assessed on the rent, the harvesting of crops thereon, or Tenant's machinery, equipment or other property installed or brought onto the Premises.

(b) Tenant shall, at its sole cost and expense, keep and maintain the Premises in good repair and appearance during the Term of this Lease, and will make all changes and repairs of every kind or nature which may be required to be made upon or in connection with the Premises or any part thereof in order to keep and maintain the Premises in such good repair and appearance. Landlord shall not be required to maintain, repair or rebuild, or make any alterations, replacements or renewals of any kind or nature to the Premises or any part thereof, whether ordinary or extraordinary, foreseen or unforeseen, or to maintain the Premises or any part thereof in any way, and Tenant hereby expressly waives any right to make repairs at the expense of Landlord which may be provided for in any statute or law in effect at the time of the execution of this Lease, or any statute or law which may thereafter be enacted.

5. Carryover. As part of the consideration, Landlord and Tenant acknowledge that a residue may exist from the nutrients applied by the Tenant and they have considered such residue in arriving at the rental arrangement. Consequently, the parties agree that the Landlord will not be indebted to the Tenant in any amount due to the existence of such residue.

6. Surrender at End of Term. Any crops or personal property remaining on the Premises or the Real Estate shall be removed by Tenant at its expense, prior to the expiration of the Term or the sooner termination hereof, failing which, such crops or personal property shall be deemed abandoned and shall immediately become the property of the Landlord. Upon the expiration of the Term or earlier expiration thereof, Tenant shall deliver the Premises to Landlord in as good a condition as existing on the date hereof, in compliance with all laws, and free of any hazardous or toxic substances.

7. Transfers. Tenant shall not sublease or assign its interest in this Lease without the prior written consent of Landlord, which may be withheld in Landlord's sole discretion. Landlord shall have the right to assign its interest in this Lease to any party in Landlord's sole discretion. If Landlord sells the Premises or assigns its interest in this Lease, Landlord shall be released from all obligations and liabilities accruing thereafter under this Lease, provided Landlord's successor has assumed in writing Landlord's obligations under this Lease.

8. Events of Default. The occurrence of any one or more of the following shall constitute an "Event of Default" hereunder: (a) Failure of Tenant to pay any amount required hereunder, which

failure shall not be cured by Tenant within 10 days of written notice from Landlord; or (b) Failure of Tenant to perform any other covenant, condition, agreement or provision contained herein within 20 days after receipt by Tenant of written notice of such failure; or (c) Commencement of bankruptcy, insolvency, assignment for the benefit of creditors or receivership proceedings in respect of Tenant; or (d) a breach or default under the Compost Agreement, which is not cured within the applicable notice and cure periods set forth in the Compost Agreement.

9. Remedies. Upon the occurrence and continuance of an Event of Default the Landlord may, at its option and without any obligation to do so, elect any one or more of the following remedies: (a) Terminate and cancel this Lease; (b) Cure such Event of Default and recover the costs thereof, together with interest thereon at the "Default Rate" (hereinafter defined), from Tenant; or (c) Pursue any other remedy now or hereafter available under the laws or judicial decisions of the State of Oregon. For purposes of this Lease, the "Default Rate" shall mean 12% percent per annum upon any such amount, and if any such amount shall remain unpaid after 6 months of receipt of notice, such rate shall increase to 18% percent per annum; provided, however, that such interest rate shall in no event exceed the maximum rate of interest permitted under the governing law of this Lease.

10. Access to Premises. Landlord may, at anytime, enter the Premises to make an examination of the same, provided Landlord does not and shall not unreasonably interrupt the farming operation or damage any growing or standing crops.

11. Relationship of Parties. The relationship between the parties hereto shall be solely as set forth herein. Neither party shall be deemed the employee, agent, partner or joint venturer of the other.

12. Brokers. Each party represents and warrants that it has not dealt with any real estate brokers and that there are no claims for brokerage commissions of finders' fees due and owing in connection with this Lease. Any party that defaults under this Section (the "Defaulting Party") agrees to indemnify and hold harmless the other party from any and all liabilities, costs and expenses (including attorneys' fees) arising from any such claim by any real estate broker or other party that has dealt with the Defaulting Party.

13. Separability. Each and every covenant and agreement herein shall be separate and independent from any other. The breach of any covenant or agreement shall in no way discharge or relieve the performance of any other covenant or agreement. Each and all of the rights and remedies given to either party by this Lease or by law or equity are cumulative, and the exercise of any such right or remedy by either party shall not impair such party's right to exercise any other right or remedy available to such party under this Lease or by law or equity.

14. No Waiver. No delay in exercising or omission of the right to exercise any right or power by either party shall impair any such right or power or shall be construed as a waiver of any breach or default or as acquiescence thereto. One or more waivers of any covenant, term or condition of this Lease by either party shall not be construed by the other party as a waiver of a continuing or subsequent breach of the same covenant, provision or condition. The consent or approval by either party to or of any act by the other party of a nature requiring consent or approval shall not be deemed to waive or render unnecessary consent to or approval of any subsequent similar act.

15. Entire Lease. This Lease together with any Exhibits or attachments hereto constitutes and represents the entire agreement between the parties hereto and supersedes any prior understandings or agreements, written or verbal, between the parties hereto respecting the subject matter herein. This Lease may be amended, supplemented, modified or discharged only upon an agreement in writing executed by all of the parties hereto.

16. Governing Law, Venue, and Jurisdiction. This Lease and all acts and transactions pursuant or relating hereto, and all rights and obligations of the parties hereto shall be governed, construed, and interpreted in accordance with the laws of the State of Oregon. In order to induce the parties to accept this Lease, and as a material part of the consideration therefore: (a) the parties hereto agree that all actions or proceedings arising out of this Lease shall be litigated in courts located within Multnomah County, Oregon; (b) the parties hereto consent to the exclusive jurisdiction of such court and consent to the service of process in any such action or proceeding by personal delivery or any other method permitted by law; and (c) the parties waive any and all rights they may have to transfer or change the venue of any such action or proceeding.

17. Subordination; Release. This Lease is and shall be subject and subordinate, at all times, to the lien of any mortgages for deeds of trust which now affect the Premises, or any ground leases hereinafter entered into by Landlord. Tenant acknowledges that Landlord or its affiliate will be developing and using the Real Estate and certain property contiguous or adjacent thereto for purposes of operating a landfill or for the handling, transportation, recycling or disposal of solid waste, and any other uses or activities in connection therewith, and Tenant (which for purposes hereof shall include any person or entity which owns or controls Tenant) agrees and hereby releases Landlord and its affiliates from any liability, damages, claims, causes of action associated with such development and use of the Real Estate and any property contiguous or adjacent thereto. Further, in the event Landlord or its affiliate requires the cooperation or execution of any documents from Tenant in connection with its use and development of the Real Estate, Tenant agrees to cooperate with any such request made by Landlord or its affiliate.

18. Notices. All notices and other communications under this Lease shall be in writing and shall be deemed to have been given 3 business days after deposit in the mail, designated as certified mail, return receipt requested, postage-prepaid, or one business day after being entrusted to a reputable commercial overnight delivery service. All notices and other communications under this Agreement shall be given to the parties hereto at the following addresses:

To Landlord:	Valley Landfills, Inc. c/o Republic Services, Inc. 18500 North Allied Way Phoenix, AZ 85054 Attn: Chief Legal Officer
And a copy to:	Spotts Fain PC 411 E Franklin Street, Suite 600 Richmond, VA 23219 Attn: David A. Reed, Esq.
To Tenant:	Agri-Industries, Inc. 3405 NE Garden Avenue Corvallis, OR 97330 Attn: Tim Winn, President

Any party hereto may change the address to which notices shall be directed under this Section 18 by giving written notice of such change to the other parties.

19. Binding Effect. All of the terms, covenants, conditions and provisions of this Lease, whether so expressed or not, shall be binding upon, inure to the benefit of, and be enforceable by he

parties and their respective administrators, executors, other legal representatives, heirs and permitted assigns.

20. Remedies Cumulative. No remedy herein conferred upon any party is intended to be exclusive of any other remedy, and each and every such remedy shall be cumulative and shall be in addition to every other remedy given hereunder or now or hereafter existing at law or in equity or by statute or otherwise. No single or partial exercise by any party of any right, power or remedy hereunder shall preclude any other or further exercise thereof.

21. Attorneys' Fees. In the event of any controversy arising under or relating to this Lease, the prevailing party shall be entitled to payment for all costs and attorneys' fees (both trial and appellate) incurred in connection therewith.

22. Liens. Tenant shall discharge any lien, encumbrance, or charge arising out of the work of any contractor, mechanic or material contracted for by Tenant or any subtenant, or on behalf of Tenant or any subtenant. If any lien on account of an alleged debt or any notice of contract shall be filed against the Real Estate or Premises, Tenant shall, within 5 days after the notice of the filing thereof, cause the same to be discharged of record by payment, deposit or bond.

23. Compliance with Laws; Environmental. (a) Tenant agrees, at its sole cost and expense, to comply with all laws, orders and regulations of federal, state and municipal authorities and with any lawful direction of any public officer which shall impose any duty upon Tenant with respect to work to be performed by Tenant on the Premises, the Premises, or Tenant's use thereof. Tenant shall, at its own expense, obtain and maintain all required licenses or permits necessary for any work to be performed by Tenant on the Premises or its use of the Premises.

(b) Tenant shall not use the Premises for the storage, use treatment, or disposal of any hazardous or toxic substances or petroleum products. Tenant agrees to indemnify, defend and hold Landlord and its officers, partners, directors, shareholders, employees and agents harmless from any claims, judgments, damages, fines, penalties, costs, liabilities (including sums paid in settlement of claims) or loss including attorney's fees, consultant's fees, and expert fees which arise during or after the Term in connection with the presence or suspected presence of hazardous or toxic substances in the soil, groundwater, or soil vapor on or under the Premises. Without limiting the generality of the foregoing, this indemnification shall survive the expiration of this Lease.

24. AS IS; WAIVER OF WARRANTIES. Tenant agrees to accept the Premises in its "AS IS" condition with all faults. TENANT AGREES THAT NEITHER LANDLORD NOR ANY AGENT OF LANDLORD HAS MADE ANY REPRESENTATION OR WARRANTY AS TO THE SUITABILITY OF THE PREMISES FOR TENANT'S USE. TENANT AGREES THAT NEITHER LANDLORD NOR LANDLORD'S AGENTS HAVE MADE ANY REPRESENTATIONS OR PROMISES WITH RESPECT TO THE PHYSICAL CONDITION OF THE LAND OR ANY OTHER MATTER OR THING AFFECTING OR RELATED TO THE PREMISES, AND NO RIGHTS, EASEMENTS OR LICENSES ARE ACQUIRED BY TENANT BY IMPLICATION OR OTHERWISE. TENANT HAS INSPECTED THE PREMISES AND IS THOROUGHLY ACQUAINTED WITH THEIR CONDITION, AND AGREES TO TAKE THE SAME "AS IS", AND ACKNOWLEDGES THAT THE TAKING OF POSSESSION OF THE PREMISES BY TENANT SHALL DE CONCLUSIVE EVIDENCE THAT THE PREMISES WERE IN GOOD AND SATISFACTORY CONDITION AT THE TIME SUCH POSSESSION WAS SO TAKEN.

25. Recording. Tenant shall not record this Lease, or any short form or memorandum hereof.

26. Time of the Essence. Time shall be of the essence in interpreting the provisions of this Lease.

27. Eminent Domain. If any portion of the Premises shall be appropriated or taken under the power of eminent domain by any public or quasi-public authority, then the Lease shall terminate as to affected portion as of the date of such taking. In no event shall Tenant have any right or claim to any award or compensation in connection therewith.

28. Indemnification. Tenant agrees to indemnify and hold harmless Landlord and its affiliated companies and their agents, servants, directors, officers, shareholders, and employees ("Indemnitees") from and against any and all liabilities, losses, damages, liens, claims, suits, causes of action, costs (including court costs, attorneys' fees and costs of investigation), and actions of any kind arising out of, caused by, resulting from or alleged to arise by reason of injury to or death of any person or damage to or loss of property occurring on, in, or about the Premises or by reason of any other claim whatsoever of any person or party occasioned or alleged to be occasioned in whole or in part by any act or omission on the part of Tenant or any invitee, licensee, employee, director, officer, servant, contractor, subcontractor or Tenant of Tenant, or by any breach, violation, or nonperformance of any covenant of Tenant under this Lease. If any action or proceeding shall be brought by or against any Indemnitee in connection with any such liability or claim, Tenant, on notice from Landlord, shall defend such action or proceeding, at Tenant's expense, by or through attorneys reasonably satisfactory to Landlord.

29. Counterparts. This Lease may be executed in counterparts, each of which shall be deemed an original and all of which shall be one Lease. A signature received by electronic mail in "portable document format" (".pdf") or facsimile shall be deemed an original.

30. Assignment. Tenant shall not assign, sublet or otherwise transfer its interest in this Lease, or permit the use or occupancy of the Premise by any other person or entity, without the prior written consent of Landlord, which may be withheld in Landlord's sole discretion.

[*Signatures appear on the page following*]

1.0 INTRODUCTION

The Coffin Butte Landfill (CBLF) is proposing to expand the waste disposal area of the landfill by using an existing property just south of Coffin Butte Road. The goal of this study was to conduct an odor dispersion modeling analysis that compares the existing and proposed operating scenarios for potential nuisance odor impacts. Since odor is a subjective human response, odor dispersion modeling was used to provide an objective approach towards understanding how on-site emissions of odor potentially impact off-site locations.

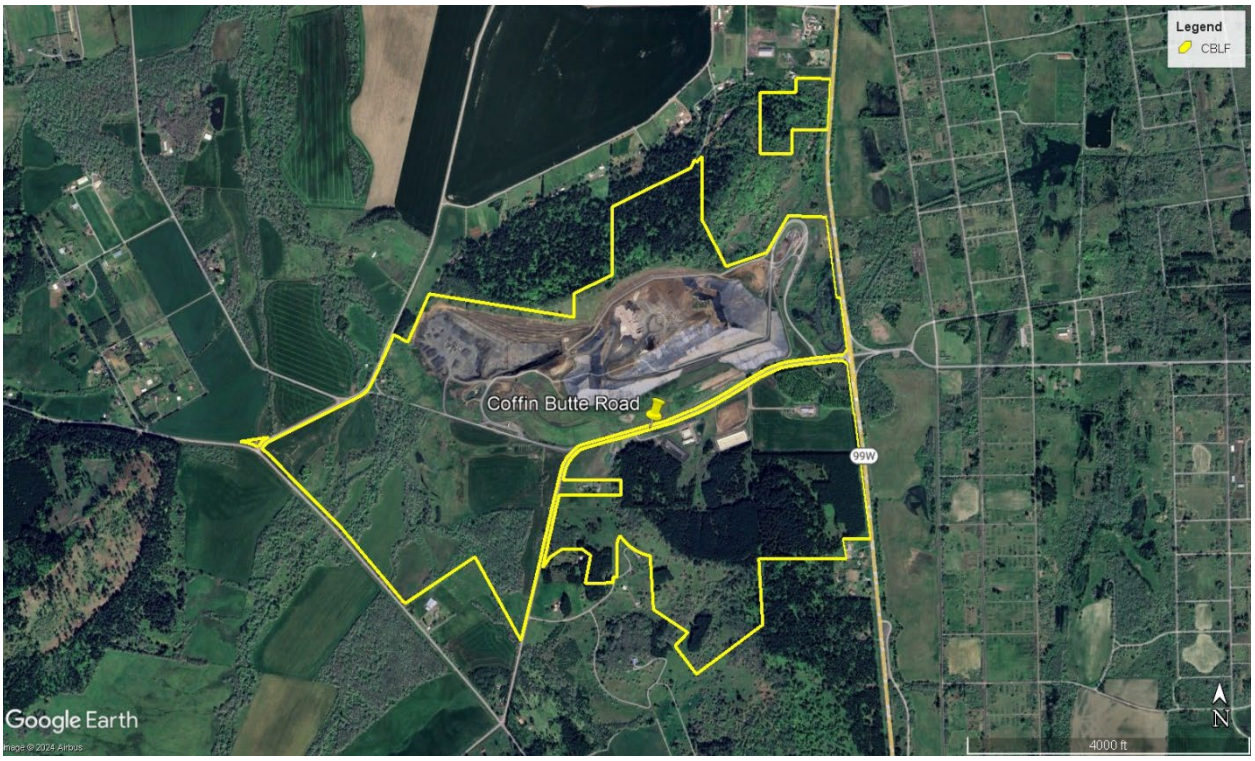
Following this Introduction, Section 2 provides a description of the facility. Section 3 describes the methodology used in this study while Section 4 summarizes the results. Section 5 then presents the conclusions. Finally, the appendices provide supporting documentation.

2.0 FACILITY DESCRIPTION

2.1 LOCATION

The CBLF is located at 28972 Coffin Butte Road in Corvallis, Oregon (Benton County). The facility is located just west of Highway 99W, approximately nine miles north of downtown Corvallis. Coffin Butte Road runs through the facility. See Figure 1 for the CBLF property boundary [1].

Figure 1. Facility Location

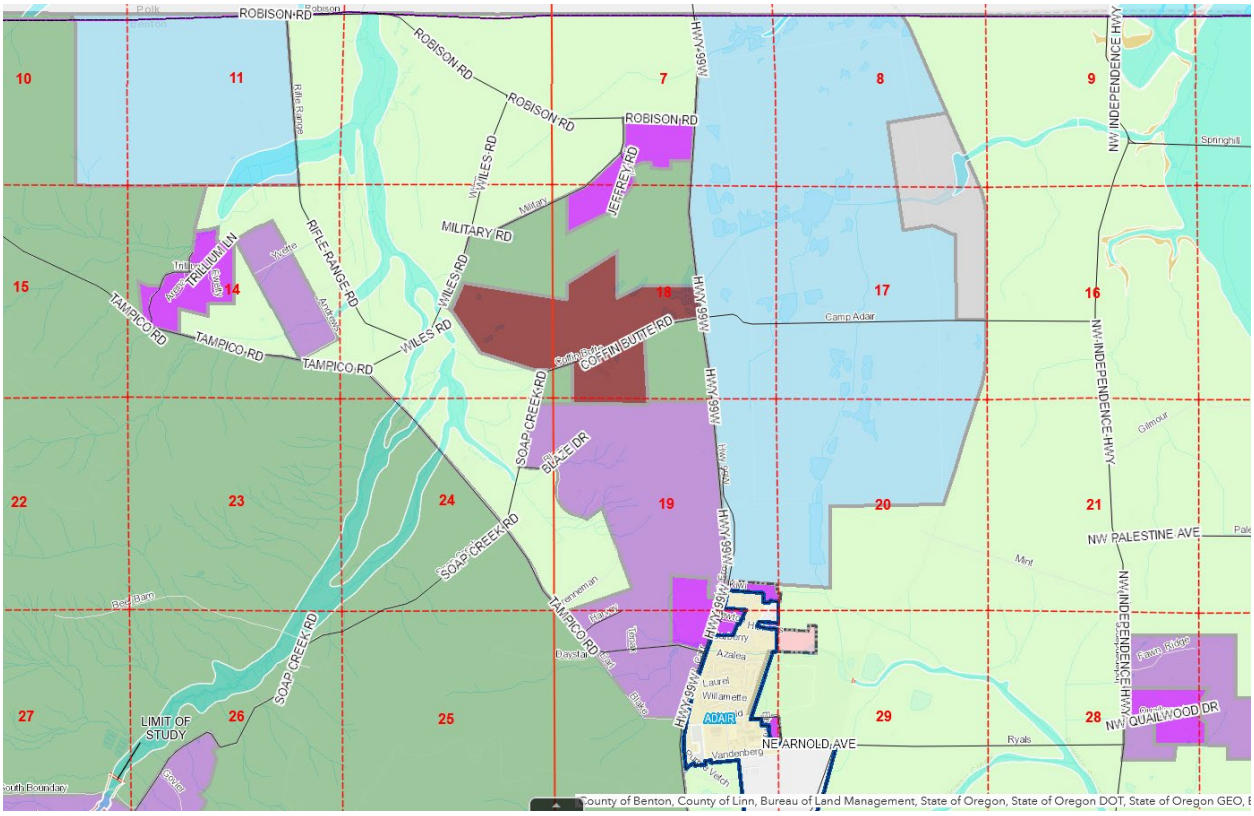


Note: Google Earth imagery from April 18, 2024.

2.2 LOCAL LAND USE / ZONING

Local land usage impacts air dispersion as surface characteristics differ for rural and urban conditions. Local land use near the CBLF is rural based upon the zoning map in Figure 2 [2].

Figure 2. Local Zoning Map



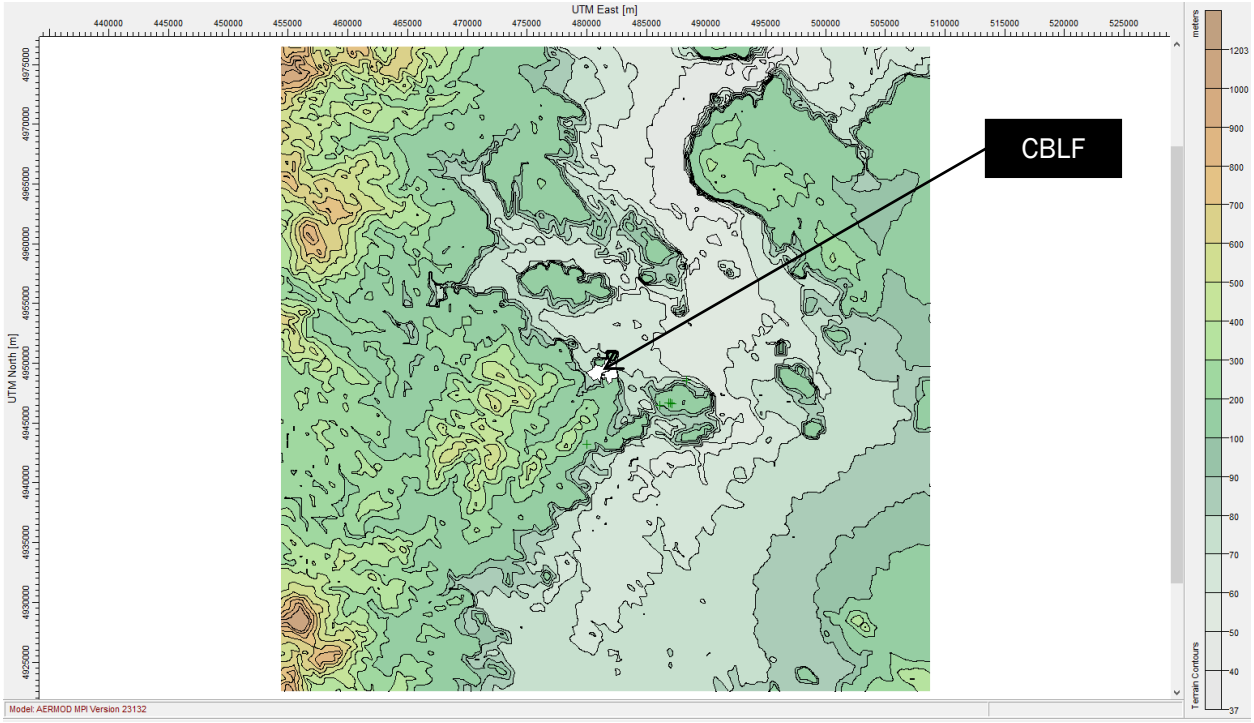
Zoning Color Code Legend:

- Exclusive farm use (light green);
- Forest conservation (green);
- Landfill (brown);
- Open space (light blue);
- Rural residential – 5 acre minimum parcel or lot size (magenta); and
- Rural residential – 10 acre minimum parcel or lot size (light magenta).

2.3 TERRAIN / TOPOGRAPHY

Local terrain also impacts air dispersion as winds can be channeled when flowing through canyons and valleys. In this case, the CBLF is located along the western edge of the Willamette Valley. See Figure 3 for the elevation contours surrounding the landfill [3].

Figure 3. Elevation Contour Map



2.4 CLIMATE AND METEOROLOGY

Local air quality is also impacted by the regional climate and meteorology as weather conditions control the transport and diffusion of emitted pollutants downwind from the release point into the surrounding area. Climate deals with long-term weather patterns while meteorology deals with short-term daily and hourly weather conditions. Nuisance odors are more likely to occur under poor meteorological conditions (e.g., low wind speed and stable wind conditions) that are common in the late night and early morning hours.

2.5 POTENTIAL ODOR ACTIVITIES

CBLF accepts commercial and public solid waste. The waste is placed in layers at the working face, compacted by heavy equipment, and then covered daily. Once an area of the CBLF has reached capacity, it is eventually capped with final cover to minimize infiltration of precipitation and release of gases not captured by the landfill gas collection and control system (GCCS). Odor is potentially emitted from sources such as:

- working face;
- tippers;
- leachate (i.e., water that has passed through the landfill's layers);
- landfill gas (LFG) which is a natural byproduct of decomposing organic material; and
- flares which burn any excess LFG collected by the CBLF.

Flares conservatively combust 98% of LFG sent to them. The 2% of un-combusted odor constituents in LFG is modeled for odors.

2.6 ODOR MONITORING AND CONTROL MEASURES

CBLF has developed and implemented a site-specific odor management plan that includes:

- application of daily cover;
- operating a LFG collection and control system;
- conducting surface emissions monitoring (SEM);
- monitoring local weather conditions (temperature, wind direction, etc.);
- conducting routine odor patrol inspections;
- responding to odor complaints received from the public and/or the Oregon Department of Environmental Quality (DEQ);
- taking action when odors are detected/reported;
- observing the area of concern for smell and conditions;
- inspecting landfill operations for any unusual activities or conditions;
- identifying possible sources of odor; and
- confirming implementation of applicable odor minimization measures.

2.7 ODOR COMPLAINT HISTORY

CBLF maintains a log of odor complaints received from the public and the DEQ. For this study, SCS Engineers (SCS) reviewed the odor complaints from 2022 through 2024 for potential patterns (e.g., time of day, day of week, season of year) as well as potential correlation to concurrent wind conditions measured on-site. For review purposes, each odor complaint log entry (event) was assigned a unique ID (1 through 84) as well as an estimated distance and wind direction from CBLF (e.g., if a complaint location was southeast (SE) of CBLF, then the concurrent wind direction at CBLF would need to be northwest (NW) for correlation). Note, odor event #1 (25 odor complaints between 11/18/21 and 2/7/22) could not be categorized since specific complaint dates/times were not provided.

Based upon the review, the following observations were made:

- Location
    - Complaint locations ranged from the adjacent surrounding area to approximately seven miles from CBLF.
    - Complaint locations varied from not provided to general areas to specific addresses.
    - The most common complaint locations specified were southwest (35%) and south (29%) of CBLF.
    - Complaint locations southwest of CBLF were within a valley whose terrain may be channeling odor from CBLF under certain wind conditions.
    - Populated areas south of CBLF include Adair Village, Lewisburg, and Corvallis.

- Time of Day
  - Odor complaints were reported in 16 different hours of the day.
  - Odor complaints peaked in the morning between 8:00 am and 11:00 am:
    - 7:00 am to 7:59 am (11%);
    - 8:00 am to 8:59 am (12%);
    - 9:00 am to 9:59 am (12%); and
    - 10:00 am to 10:59 am (7%).
- Complaints in a Single Day
  - Two days each had five odor events (1/18/2024 and 2/3/2024).
  - Two days each had four odor events (5/23/2024 and 12/1/2024).
  - Four days each had three odor events (2/10/2024, 2/20/2024, 4/1/2024, and 12/29/2024).
  - Seven days each had two odor events.
  - Thirty nine days each had one odor event.
- Day of Week
  - Odor events were reported on each day of the week and peaked on Thursday:
    - Thursday (20%);
    - Saturday (19%);
    - Friday (17%);
    - Tuesday (14%);
    - Sunday (11%);
    - Wednesday (10%); and
    - Monday (8%).
- Month and Season of the Year
  - The odor events peaked in December with the top four months being:
    - December (24%);
    - February (23%);
    - August (11%); and
    - January (10%).
  - The odor events peaked in the winter:
    - Winter (46%);
    - Fall (24%);
    - Summer (18%); and
    - Spring (12%).
  - Thermal inversions could be a contributing factor to the odor complaints. Radiation from the sun can heat the ground which in turn can warm the air near the Earth's surface. When warm air expands and cools as it rises, air temperature decreases with altitude. However, a thermal inversion occurs when air temperature increases with altitude. There are two kinds of thermal inversions: surface and aloft. Surface inversions can result in poor air quality (e.g., odors) as pollutants are trapped near ground level, dispersing only horizontally within the inversion. Surface inversions are stronger and more common during the winter months when winds are calm, skies are clear, and nights are long [4, 5]. Thermal inversions were not considered when evaluating each individual odor event. Air temperature needs to be measured at different heights to determine if a thermal inversion exists. The on-site meteorological station only collected air temperature data at one height. Any odors trapped within an inversion would still disperse horizontally based upon wind direction.
- Correlation of Odor Complaint to On-Site Wind Data

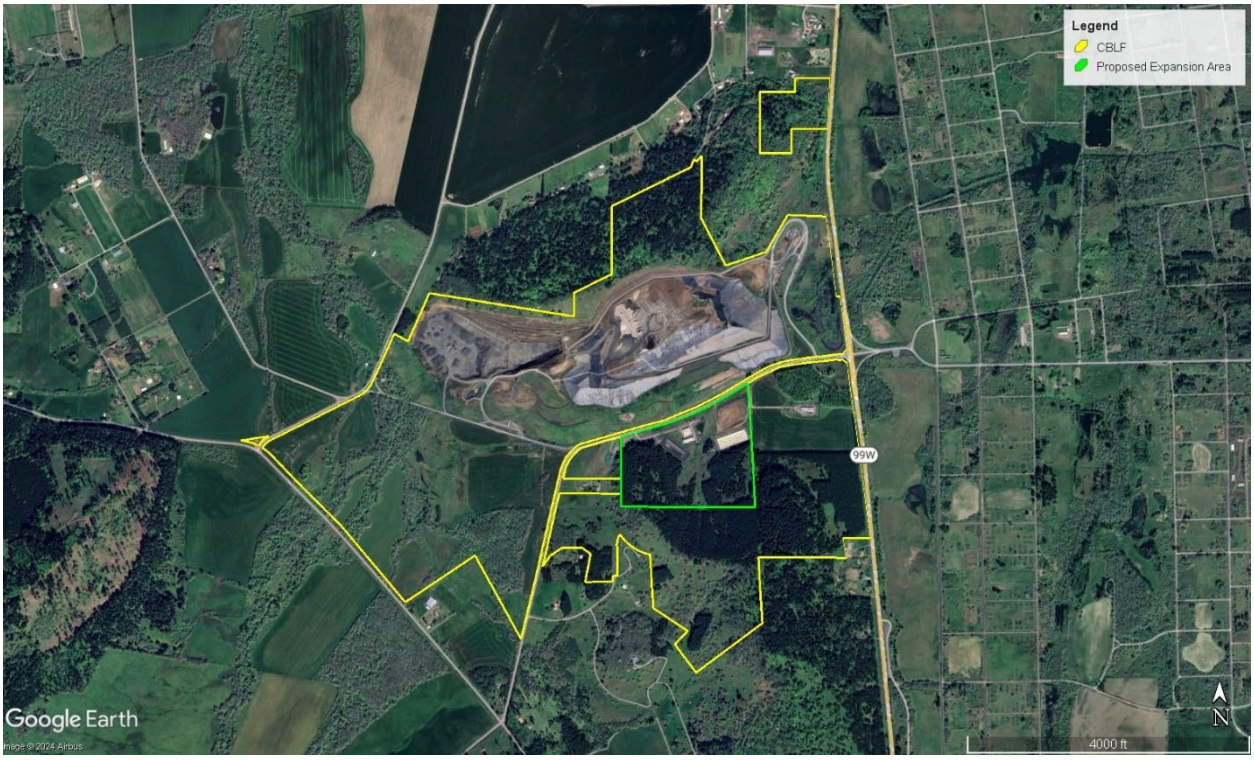
- Correlation of odor complaints to on-site wind data took into account several factors including complaint location (distance and direction relative to CBLF), complaint time, and the wind speed/direction at and before the complaint time.
- Odor events were then categorized as follows for correlation:
  - "Likely" based on complaint location and wind conditions (1%);
  - "Not likely" based on complaint location and wind conditions (29%);
  - "Possible" due to ambiguity or lack of data (58%); and
  - "Unknown" due to complaint time not specified (12%).

See Appendix A for the odor complaint review details.

2.8 PROPOSED PROJECT

CBLF is requesting approval of a conditional use permit (CUP) application to expand the area on which landfill activities will be conducted to the south side of Coffin Butte Road (the "Development Site"). In addition to using the Development Site for the landfill, the proposed changes include an 1,800-square-foot employee building and parking on land to the west of the landfill, access road modifications on lands to the north, and the relocation of leachate ponds, leachate loadout, leachate sump, an outbound scale, portions of the perimeter landfill road, the shop/maintenance area, cut activities for landfill, and leachate ponds to support the landfill onto the property to the east (collectively, the "Project") [6]. Figure 4 displays the location of the expansion area in relation to existing operations.

Figure 4. Proposed Expansion Area (Taxlot 104180001107)



2.9 OTHER POTENTIAL SOURCES OF ODOR IN THE REGION

Although this study only addresses potential odor impacts from the CBLF, it is important to note that other potential sources of odor exist in the region including (but not limited to):

- Agriculture.
- Biosolids land application fields (used only in summer months, but not every).
- Compost / organics recycling facility.
- Wastewater treatment plant.

3.0 METHODOLOGY

Since odor is a subjective human response, odor dispersion modeling provides an objective approach towards understanding how on-site emissions of odor potentially impact off-site locations. The following summarizes the methodology used in this study.

3.1 MODEL SELECTION

The American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) (Version 24142 incorporated into the Lakes Environmental AERMOD View 13.0 software suite) [7] was used to model estimated emissions of odorous pollutants from the landfill and predict maximum, off-site, 1-hour concentrations for each pollutant using the rural dispersion mode and elevated terrain.

AERMOD was selected for this study since:

- AERMOD is preferred/recommended by the EPA for near-field dispersion of emissions for distances less than 50 kilometers in both simple and complex terrain.
- AERMOD is acceptable to the DEQ for dispersion modeling studies [8].
- AERMOD has undergone numerous validation studies.
- AERMOD is in the public domain and is readily available.
- AERMOD can model multiple sources and multiple receptors.
- AERMOD can use representative meteorological data to simulate atmospheric conditions that affect the transport and dispersion of air pollution from sources.
- AERMOD can use local terrain data to model receptors in complex terrain.
- AERMOD can be used to model impacts of odor causing pollutants.

Input data for AERMOD included the following which are described below:

- source parameters (locations, dimensions, emission rates, etc.);
- receptor locations;
- meteorological data;
- terrain data; and
- model options.

See below for details regarding the AERMOD model input.

3.2 SCENARIOS MODELED

In order to estimate odors from the landfill at its current state as well as with the proposed expansion, modeling was performed in two scenarios. The first scenario (Scenario #1) modeled actual operations in 2023 using estimated emission rates from the following resources:

- Revised 2023 Annual Title V Report (October 11, 2024) for criteria pollutants using process throughputs and emission factors that have already been approved by DEQ;
- Revised 2023 Air Toxics Emission Inventory (ATEI) (August 2024) for speciated air toxics and Volatile Organic Compounds (VOCs) using process throughputs and emission factors that have already been approved by DEQ; and

- U.S. EPA LandGEM model (LandGEM) ran for the 2023 ATEI for additional non-toxic pollutants not included above assuming an EPA default 75% collection efficiency and 98% destruction efficiency by the flares[1].

The second scenario (Scenario #2) looked at year 2052, which is the estimated closure year if current tonnages of waste acceptance from 2023 continue. 2052 would also see the highest landfill gas generation rate based on the model. A 75 collection efficiency was used in this scenario as well. The estimated waste design capacity will be 41,110,068 tons including the expansion area.

A third scenario was considered to show a middle point in landfill expansion, but is dependent on the odor results of the first two scenarios to see if needed.

3.3 SOURCE PARAMETERS

Source parameters were used to model the release of odorous pollutants from the fugitive landfill surface, landfill gas flares, the tipper engines, and the aggregate insignificant (AI) source. The AI source is incorporated by DEQ into each criteria pollutant emission total for the facility, taking into consideration sources that are too small to be permitted.

In Scenario #1, the fugitive landfill source was located in the currently permitted waste area North of Coffin Butte Road. In 2023, two open (candlestick) flares were present at the landfill, as well as two tipper engines and the AI source.

Scenario #2 is proposed to include a fugitive landfill source in the current permitted area, as well as an expansion area South of Coffin Butte Road. Since 2023, the two open flares have been replaced with one enclosed flare with a landfill gas capacity of 3,390 standard cubic feet per minute (scfm). For a conservative approach, it is assumed that all landfill gas collected is going through this flare even though a landfill gas to energy (LFGTE) plant is on-site and expected to control a significant amount of the gas. The proposed landfill gas generation rate from LandGEM in 2052 would exceed this flare's capacity, but for simplicity all emissions were still modeled from this flare source, as a second flare with similar exhaust parameters would be installed close by if needed. The tipper engines and AI source parameters were not changed in Scenario #2; however, these sources were moved to the expansion area as the final buildout's active face would likely be in this region. The size of the AI source needed to be shrunk in order to fit in the smaller expansion area.

Tables 1 through 3 summarize the source parameters modeled while Figure 5 displays the modeled source locations. Most model parameters were taken from the November 2024 Modeling Report submitted to DEQ for CBLF. A revised extent of waste was used for the fugitive landfill surface source, with sources in the expansion area estimated based on engineering drawings.

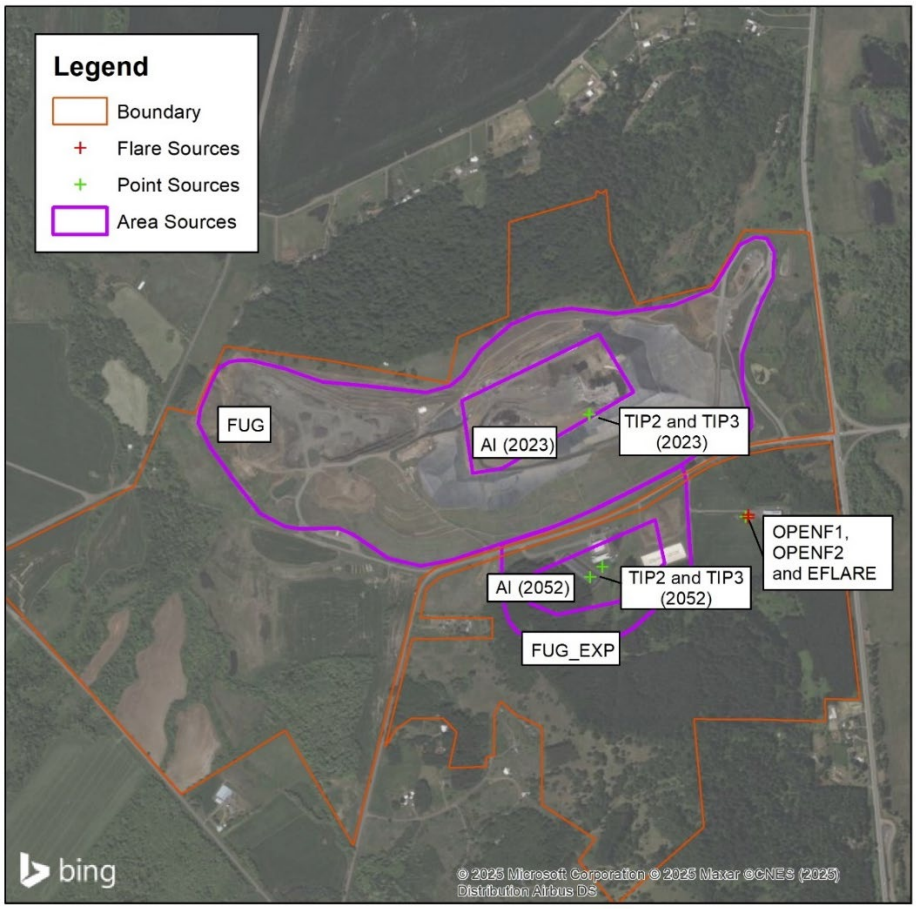
AI (2052)	Aggregate Insignificant	281.6	668,917	0	0

Figure 5. Modeled Area Source Locations



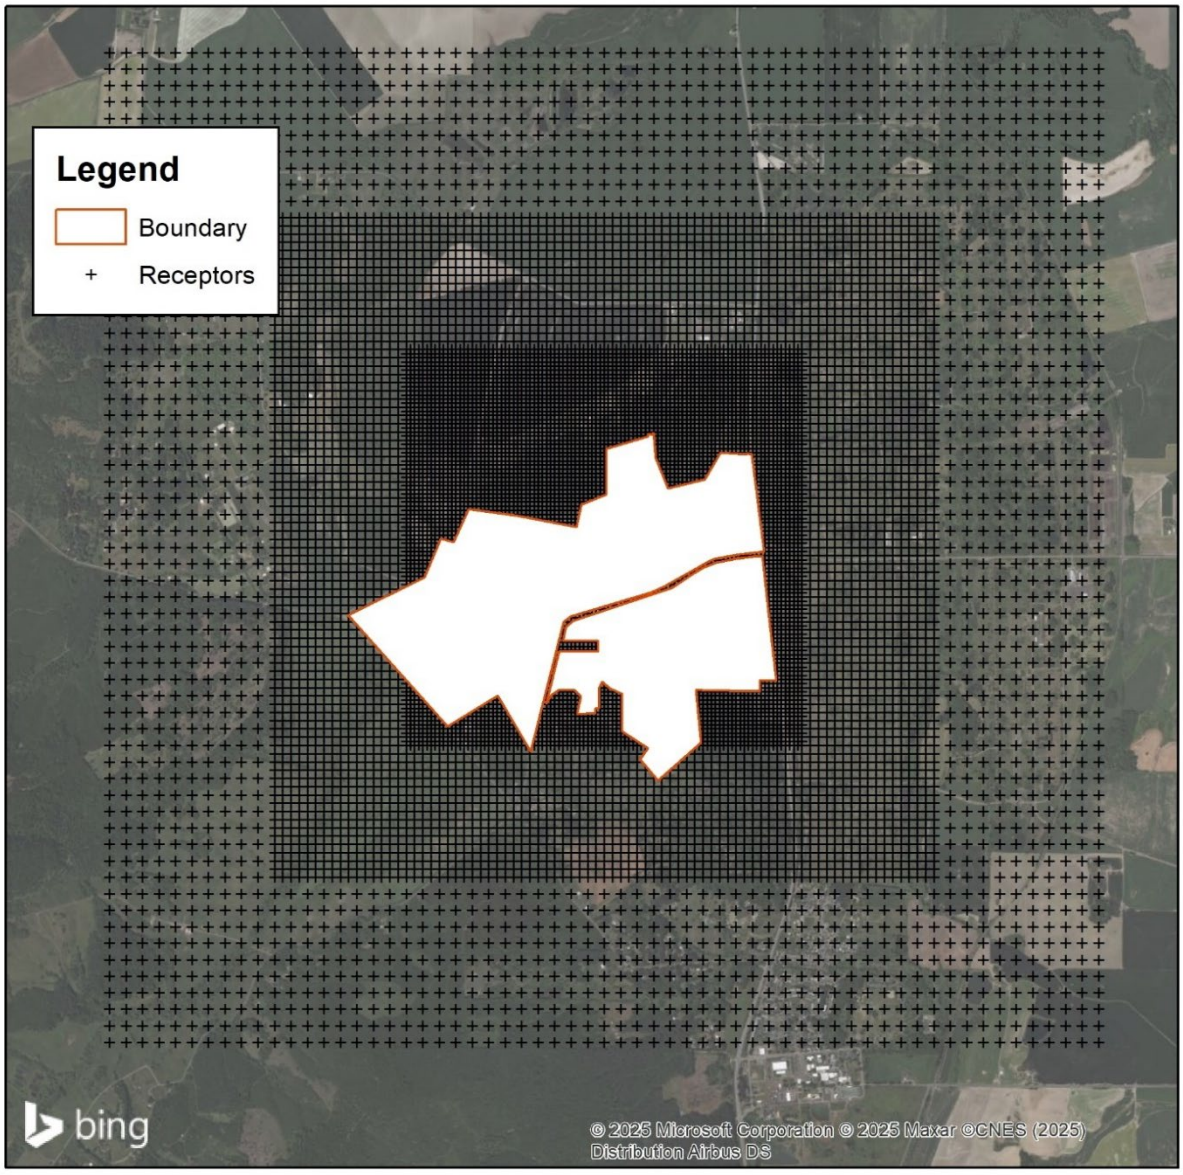
3.4 BUILDING DOWNWASH

Building downwash occurs when wind flowing over/around buildings impacts the dispersion of pollution from nearby stacks (point sources). One building exists 140 feet East of the flares where the LFGTE plant is located. This building is 175 feet by 60 feet wide and 25 feet tall.

3.5 RECEPTORS

AERMOD was used to generate nested 25-meter, 50-meter, and 100-meter spaced receptor grids over the landfill and surrounding area. Receptor flag pole heights were set to zero meters (ground level). On-site receptors within the landfill's property boundary were removed from the analysis. See Figure 6 for the layout of the nested grids.

Figure 6. Nested Receptor Grid



3.6 METEOROLOGICAL DATA

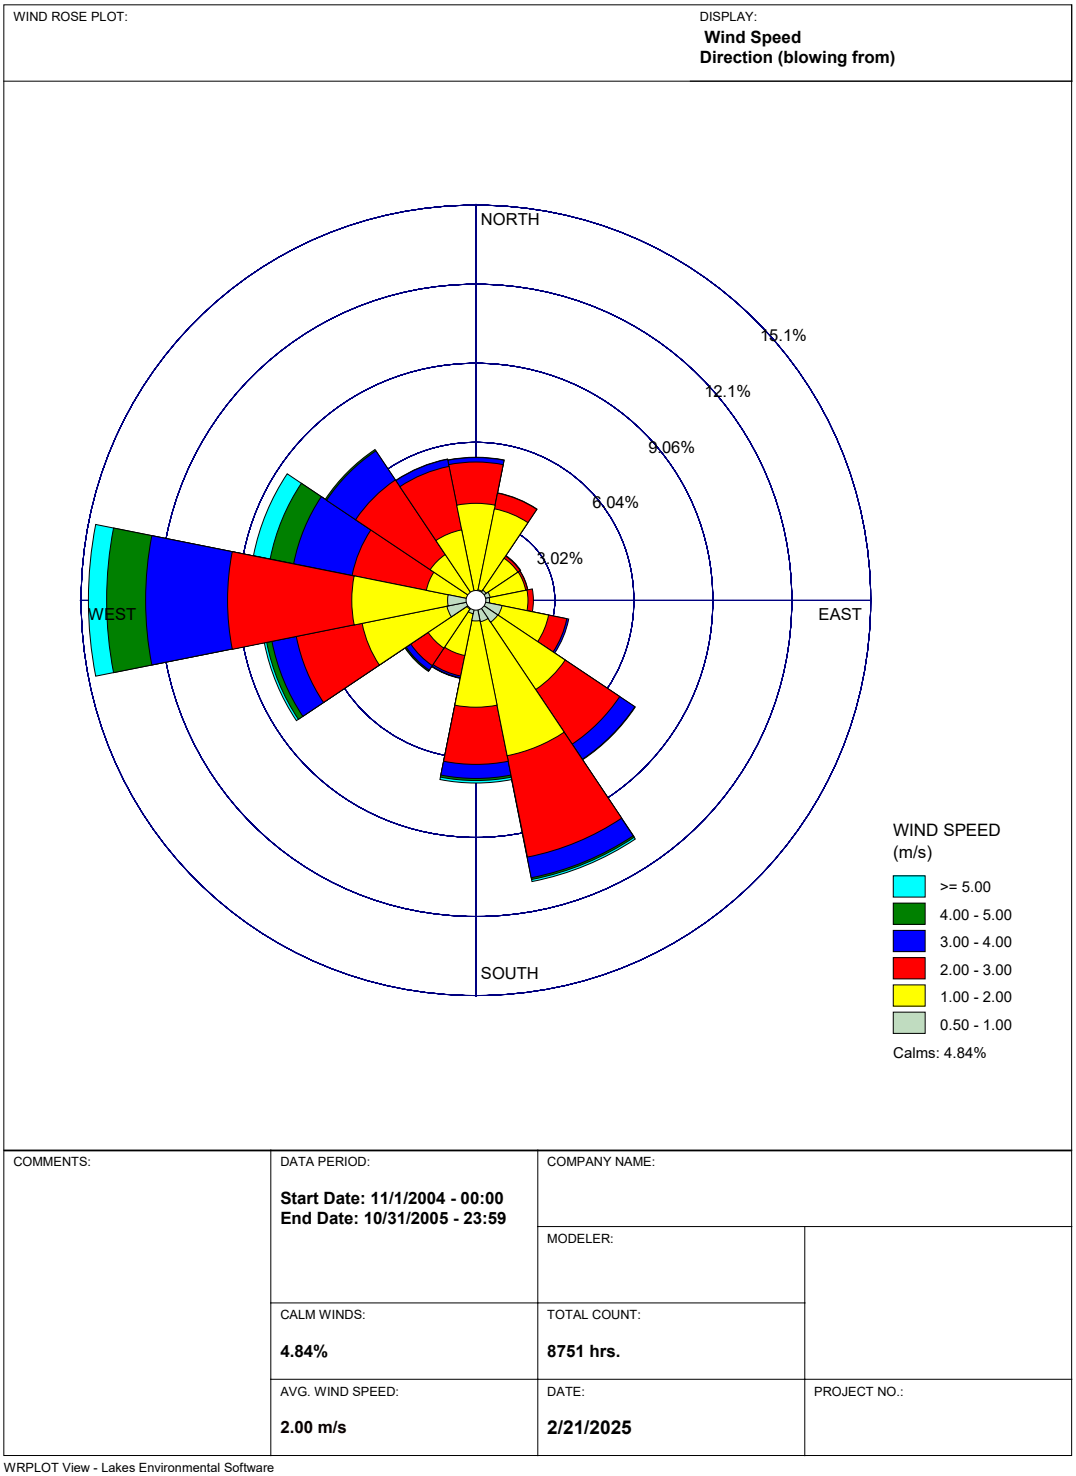
On-site data was collected between November 1, 2004 and October 30, 2005 by CH2M HILL to support permitting for the LFGTE facility (operated by Pacific Northwest Generating Cooperative) expansion which added two additional engines to the facility in 2006. At the time of collection, the meteorological station was located on-site, at a location recommended by DEQ, approximately 100 feet southeast of the LFGTE facility. The data collected from the onsite station included wind speed, wind direction, standard deviation of horizontal wind direction, temperature, delta temperature, and solar radiation. Data for this period is available for 8,727 hours for the year, resulting in a data availability of 99.9%, with greater than 90% availability for any single parameter. Additional details regarding the collected on-site data are available in the 2006 Air Modeling Report prepared by CH2M HILL.

This data set is characterized by strong west-southeast wind pattern. The meteorological data summary was included in the Modeling Protocol approved by DEQ.

The Salem McNary Field was used as the upper air data set. AERSURFACE was used to calculate site specific values for albedo, Bowen ratio, and surface roughness on an annual basis for 12 surface sectors.

A wind rose displays wind speed and wind direction graphically for a designated historical time period. Figure 7 displays the lower altitude (surface) wind rose for the meteorological data modeled in this study. Dominant surface wind patterns occur from the south-southeast and west in this meteorological set. Note, wind data in Figure 7 was measured during a different time period and at a different location than the on-site wind data used for the odor complaint analysis. Therefore, the wind data in Figure 7 was not used in the odor complaint analysis.

Figure 7. Wind Rose of Modeled Meteorological Data



3.7 TERRAIN DATA

Local terrain data was first downloaded from the United States Geological Survey (USGS) 1 arc-second National Elevation Dataset (NED). Elevations were then processed and imported into AERMOD for the sources and receptors modeled.

3.8 NUISANCE ODOR THRESHOLD

Oregon state laws prohibit businesses from emitting odors which cause a nuisance. These nuisance laws are implemented by the DEQ which has developed a strategy for responding to odor complaints reported through an online tool. The strategy emphasizes early odor detection, voluntary cooperation, and the rapid resolution of nuisance conditions related to odors [9]. Since the DEQ has not specified a protocol for odor evaluations, this study modeled pollutants individually so that predicted off-site concentrations could be directly evaluated against the individual pollutant's published odor detection threshold to determine whether the individual pollutant may be detectable in residential or commercial land use areas. Pollutant-specific odor thresholds were obtained from the following resources [10, 11, 12]:

- American Industrial Hygiene Association (AIHA), "Odor Thresholds for Chemicals with Established Occupational Health Standards, 3rd edition".
- National Oceanic and Atmospheric Administration (NOAA), "Computer-Aided Management of Emergency (CAMEO)".
- United States Environmental Protection Agency (EPA), "Health Effects Notebook for Hazardous Air Pollutants".

Note, many pollutants have a range of published odor thresholds. For this study, the lowest odor threshold published by AIHA was used for most pollutants. For pollutants with wide ranges in odor thresholds (e.g., sulfur based compounds such as hydrogen sulfide), the published odor threshold from CAMEO was used. CAMEO was also used for one pollutant that did not have a published odor threshold from AIHA. Finally, EPA odor thresholds were used for two pollutants that either did not have a published odor threshold from AIHA or had an EPA odor threshold lower than the published odor threshold from AIHA. See Appendix E for the odor thresholds modeled in this study.

Scenario #1 (2023 actual operations) had 49 pollutants with published odor thresholds. Since emission rates and odor thresholds vary by pollutant, the 2023 emissions (taken from the 2023 ATEI as well as non-toxics from LandGEM) were screened for pollutants with the highest potential for causing off-site odors. This was accomplished by ranking each pollutant based on the ratio of facility level emissions (in units of grams per second) to odor threshold (in units of grams per meter cubed). Based upon this screening process, this study focused upon evaluating the following top eight pollutants (approximately 95% of the 2023 odor emissions):

- Dimethyl sulfide (methyl sulfide);
- Ethyl benzene;
- Ethyl mercaptan (ethanethiol);
- Hydrogen sulfide;
- Methyl mercaptan;
- Nitrogen oxides (NOx as NO_2);
- Toluene; and
- Xylenes.

See Appendix B for the odor pollutant screening results.

3.9 SCENARIO EMISSION RATES

Emissions of the eight pollutants with the highest odor potential as mentioned in Section 3.8 were calculated for both Scenario #1 and #2. As mentioned, the estimated actual emissions from 2023 were used for Scenario #1. Hydrogen Sulfide, Xylene, Toluene, and ethyl benzene from this ATEI were directly brought into the model. The only change to sources from the ATEI was the landfill surface, noted as F-LFG1 and F-LFG2, which were combined and modeled as FUG. Dimethyl sulfide, methyl mercaptan, and ethyl mercaptan were taken from LandGEM for the 2023 year, which determined 591.58 MMscf of landfill gas was emitted fugitively and 607.56 MMsf of landfill gas was combusted by the open flares. These three pollutants are only present in the landfill gas sources. Nitrogen oxides (NOx) emissions were taken from the 2023 annual Title V emission calculations reported to DEQ. See Appendix C for Scenario #1 emission rates.

Scenario #2 requires LandGEM to estimate future yearly tonnages until the design capacity is reached. The design capacity is 41,110,068 tons including the expansion area, which will be reached in year 2052 assuming the 2023 waste acceptance of 930,373 tons continues annually. This would generate 1,132 MMscf of fugitive landfill gas and 3,399 MMscf of collected gas in year 2052. The same methodology from Scenario #1 was used to calculate fugitive and flare emissions using the permitted emission factor for NOx of 27.35 lb/MMscf. The total landfill fugitive surface area is 1,011,815 square meters, with 81% of this being in the current area, and 19% in the southern proposed expansion. Total fugitive emissions were split between FUG and FUG_EXP based on this area percentage. See Appendix D for Scenario #2 emission rates for the eight targeted odorous pollutants.

Emissions by source for each scenario are shown in Tables 4 and 5 below.

Table 4. Scenario #1: 2023 Emissions By Source (g/s)

Pollutant	FUG	OPENF1	OPENF2	TIP2	TIP3	AI
Ethyl Benzene	1.06E-02	1.04E-04	1.14E-04			
Hydrogen Sulfide	2.63E-02	2.57E-04	2.82E-04

4.0 RESULTS

Tables 6 and 7 summarize the peak, off-site, 1-hour pollutant concentrations for each modeling scenario in units of micrograms per meter cubed (ug/m3). Each pollutant impact was then compared to its odor threshold via a ratio called dilution to threshold or D/T (i.e., maximum impact divided by odor threshold). A D/T ratio of less than one indicates that the predicted impact would not cause a detectable nuisance odor impact. See Figure 8 for the peak, off-site impact locations. Figures 9 through Figure 12 show the odor concentration contours from the two pollutants in each scenario with the highest D/T values. For each scenario, NOx had the highest D/T with the tipper engines as driving sources, and dimethyl sulfide had the highest D/T with the fugitive landfill surface as the driving source. All six of the remaining pollutants would show similar contours to dimethyl sulfide as they have the same driving source.

Table 6. Scenario #1: 2023 Model Results

Odor Pollutant	Max Impact (ug/m3)	Odor Threshold (ug/m3)	Max D/T	Driving Source	Max Impact Easting UTM Zone 10 (m)	Max Impact Northing UTM Zone 10 (m)
Dimethyl sulfide (methyl sulfide)	**0.38**	**2.54**	**0.15**	**FUG**	**481,895**	**4,950,080**

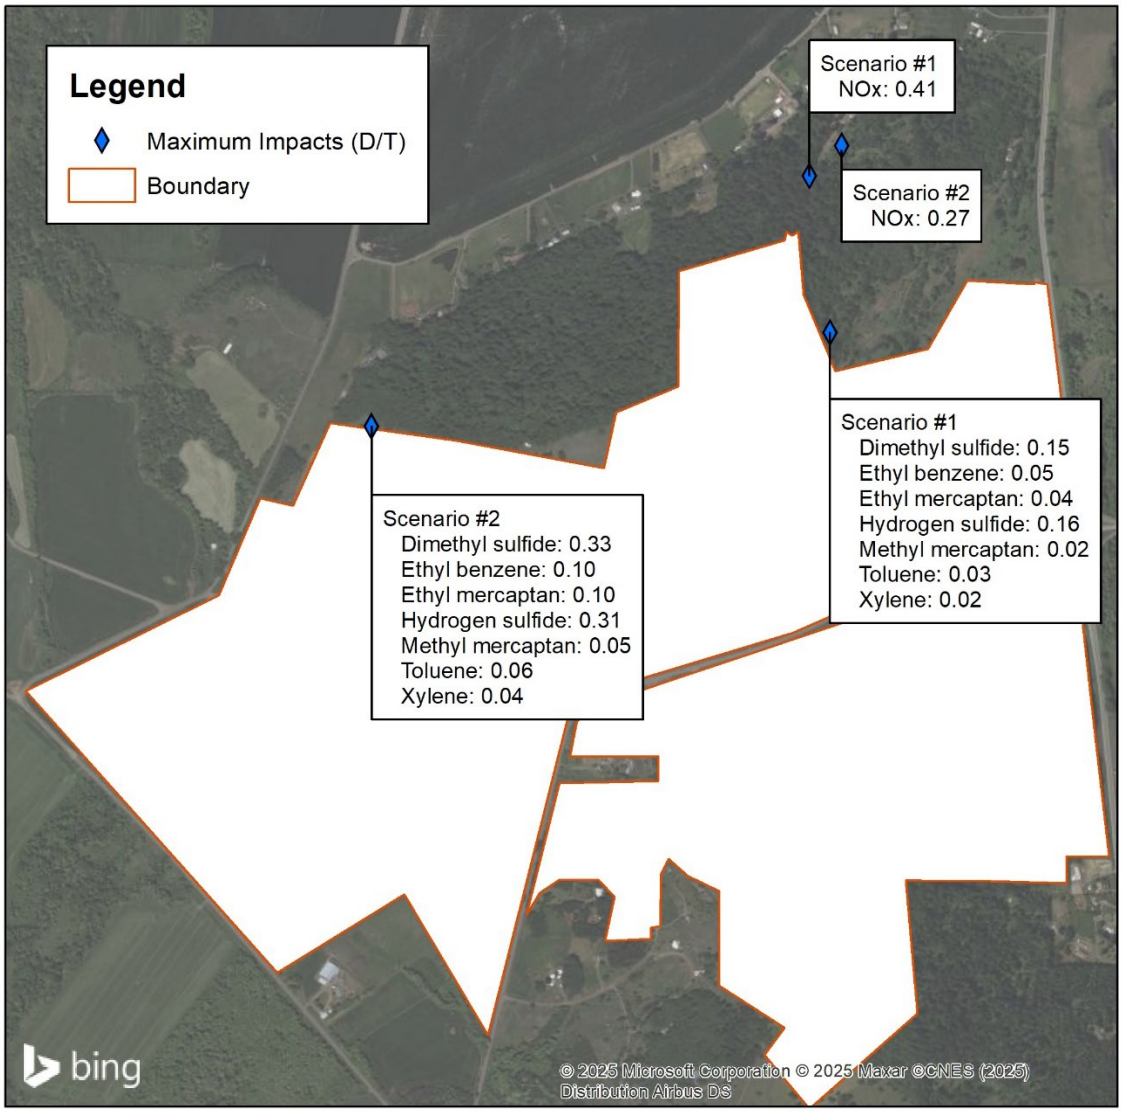
Figure 8. Peak 1-Hour Off-site Odor Impact Locations



No odor pollutants individually exceeded a D/T value of 1 in this analysis. However, isopleths are shown in the next four figures for NOx and dimethyl sulfide in both scenarios to show where odor impacts are expected to be highest based on modeling. Scenario #2 shows a 2 to 2.5 times increase in impacts from all pollutant driven by the fugitive source as landfill gas generation from the landfill is expected to significantly increase from 2023 to 2052. Scenario #1 shows the higher impacts from Nox as relocating the tipper engines and AI source to the southern expansion area is much better for modeling, having a larger buffer to the North and being at a lower elevation.

Based on the odor results in Scenario #1 and #2, a third scenario in the middle of expansion does not seem necessary. This middle scenario would show results in between Scenario #1 and #2 with slight differences based on landfill mound height in the expansion area and would certainly show D/T values less than 1 for all pollutants.

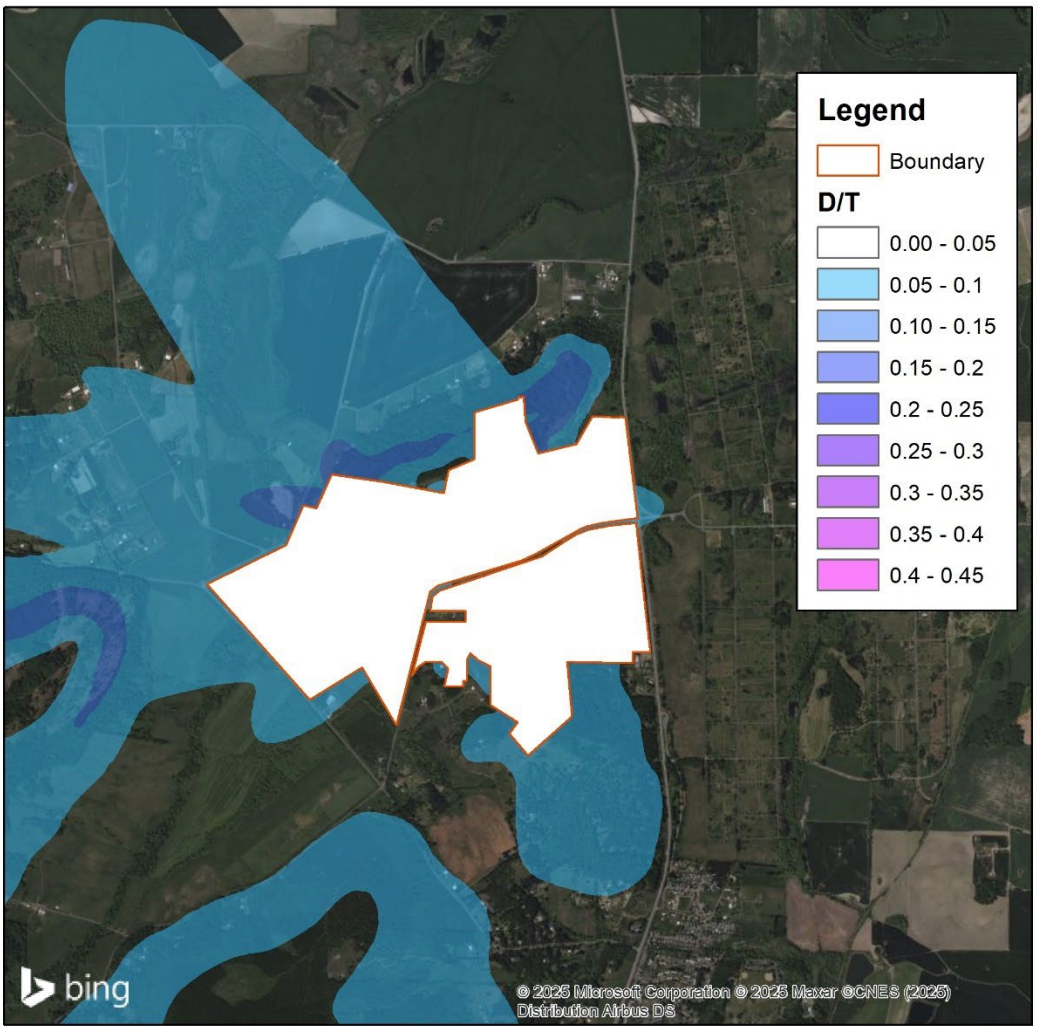

Figure 11. Scenario #2 NOx Odor D/T Contours

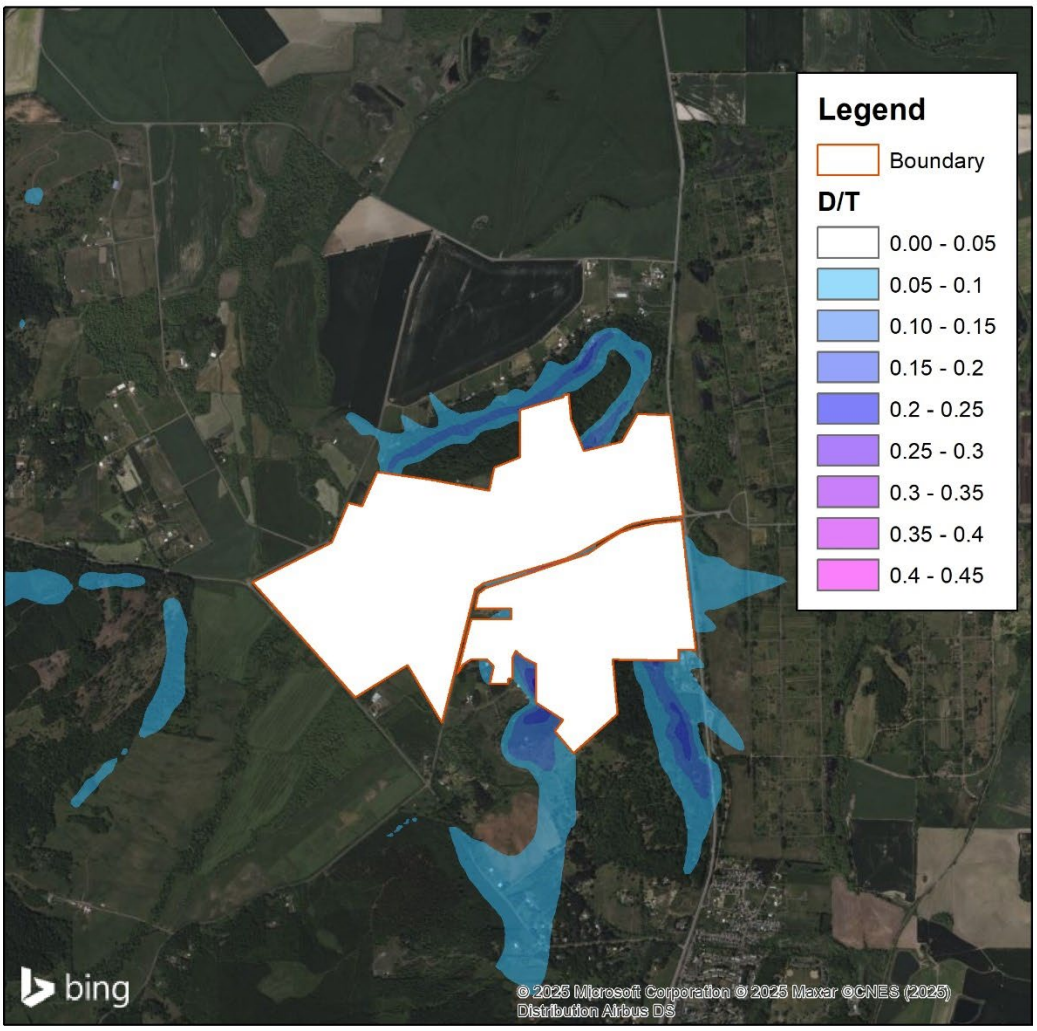

Figure 12. Scenario #2 Dimethyl Sulfide Odor D/T Contours

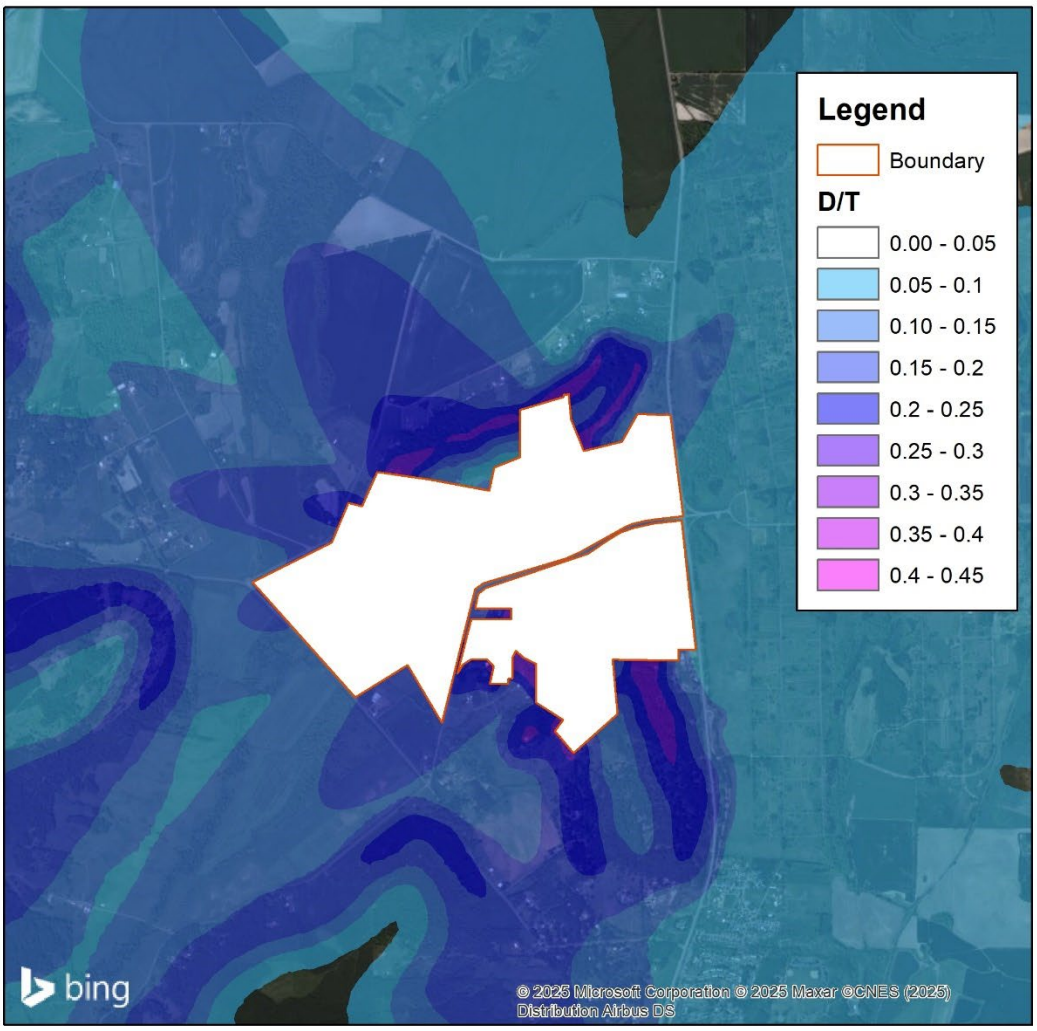

5.0 CONCLUSIONS

5.1 ODOR COMPLAINT ANALYSIS

Based upon the analysis of the odor complaints logged in 2022 through 2024, the following conclusions are presented:

- Complaint locations ranged from adjacent to CBLF to as far as seven miles away.
- Most complaints were located Southwest and South of CBLF, requiring wind from the North or Northeast to be coming from the landfill.
- Based upon the 2022 through 2024 weather data measured on-site; winds were from the North 3.1% of the time and from the Northeast 4.6% of the time (the dominant wind direction was from the South-Southwest 18.7% of the time).
- Complaints peaked in the morning from 8:00 AM to 11:00 AM.
- Complaints specifically peaked in winter months, possibly due to thermal inversions. Colder temperatures have less thermal mixing which leads to higher air quality and odor impacts.
- Correlating the complaint location to wind data during the complaint time showed only 1% of complaints "likely" to come from the landfill and 58% to be "possible" from the landfill.

5.2 ODOR DISPERSION MODELING

Since the DEQ has not specified a protocol for odor evaluations, this study modeled pollutants individually so that predicted off-site concentrations could be directly evaluated against the individual pollutant's published odor detection threshold to determine whether the individual pollutant may be detectable in residential or commercial land use areas. This evaluation was accomplished using a D/T ratio for each pollutant modeled (i.e., maximum 1-hour pollutant concentration modeled divided by its odor threshold). A D/T ratio of one for each pollutant was then used as the threshold for determining whether the existing landfill or proposed expansion project would cause a detectable nuisance odor impact.

Based upon the modeling results of the two scenarios, the following conclusions are presented:

- Scenario #1 (2023 actual operations) was not expected to cause detectable nuisance odors since the D/T ratio for each pollutant modeled was well below one.
- Scenario #2 (2052 proposed operations) was not expected to cause detectable nuisance odors since the D/T ratio for each pollutant modeled was well below one.
- Scenario #2 (2052 proposed operations) D/T ratios increased by 2 to 2.5 times as compared to Scenario #1 (2023 actual operation) for all pollutants except NOx. The decrease in the NOx D/T ratio was due to the change in tipper and AI location. As noted above, all D/T ratios were well below one.
- Peak impact locations were all north of the landfill boundary in Scenario #1 and Scenario #2.
- Moving operations to the proposed expansion area will move the predicted peak, off-site 1-hour impact locations, but the D/T ratio for each pollutant would remain below one.

Typically, odors become a nuisance at or above 7 D/T [13, 14] so using 1 D/T for comparison is expected to be conservative. Therefore, this study concludes that the proposed expansion Project will not cause detectable off-site nuisance odor impacts at nearby residential or commercial areas.

55	5/23/2024	9:30 AM	forwarded from DEQ	5 miles south, adair	"coffin Butte's effluence"	~ 5 miles	N	NNE	North-northeast wind (3 mph). Winds were from the north-northeast (0-4 mph) between 0730 and 0930 hours.	Possible
56	5/23/2024	6:00 PM	forwarded from DEQ	"near coffin Butte"	"trash and rotten egg"	~ 0 miles	Various	NE	Northeast wind (10 mph). Strong winds are not typically associated with odor complaints.	Not likely
57	7/12/2024	12:06 AM	forwarded from DEQ	"south of the landfill"	"landfill smell"	~ 0 miles	N	WSW	West-southwest wind (3 mph). Winds were from the northwest (1-2 mph) between 2300 and 2330.	Not likely
58	7/24/2024	1:00 PM	forwarded from DEQ	near SE corner of Landfill buffer property	Noticeable unpleasant methane odor	~ 0 miles	NW	S	South wind (6 mph). Winds were from the northwest (4 mph) at 1230 hours.	Possible
59	7/30/2024	5:30 PM	forwarded from DEQ	4 miles SE of landfill	"landfill dump smell"	~ 4 miles	NW	SW	Southwest wind (6 mph).	Not likely
60	8/4/2024	8:30 AM	forwarded from DEQ (8/26)	SW of Landfill or driving by	dump stench	~ 0 miles	NE	Calm	South wind (0 mph). Wind was calm (0 mph) between 0600 and 0830 hours.	Possible
61	8/8/2024	7:40 AM	Ryan Griffin	Oak Grove Drive & Powers	"dump smell, like driving by", "10"	~ 4 miles	WNW	Calm	West-southwest wind (0 mph). Winds were from the west-southwest (0-3 mph) between 0330 and 0800 hours.	Not likely
62	8/8/2024	7:45 AM	Lauren Griffin	Palestine & Oak Grove	"9"	~ 3.8 miles	WNW	Calm	West-southwest wind (0 mph). Winds were from the west-southwest (0-3 mph) between 0330 and 0800 hours.	Not likely
63	8/9/2024	3:15 PM	forwarded from DEQ	(N/A)	Piercing garbage smell	(N/A)	(N/A)	WNW / NE	West-northwest wind (2 mph) at 1500 hours. Northeast wind (2 mph) at 1530 hours.	Possible
64	8/9/2024	5:53 PM	forwarded from DEQ	"miles away"	"terrible smell"	~ 2+ miles	(N/A)	SW	Southwest wind (10 mph). Strong winds are not typically associated with odor complaints.	Not likely
65	8/18/2024	7:30 AM	Ryan Griffin	Oak Grove Drive & Powers	"smells like driving by the dump", 8	~ 4 miles	WNW	Calm	South wind (0 mph). Winds were calm (0 mph) between 0500 and 0730 hours except from the south (2 mph) at 0630 hours.	Not likely
66	8/23/2024	6:30 PM	forwarded from DEQ	South of Landfill	"landfill chemical stink"	~ 0 miles	N	NW	Northwest wind (1 mph).	Possible
67	11/26/2024	11:30 AM	forwarded from DEQ	(N/A)	"Coffin Butte dump stench"	(N/A)	(N/A)	SE	Southeast wind (2 mph).	Possible

Comparison of CBLF Odor Complaints to On-site Wind Data

Odor Event ID	Odor Event Date	Odor Event Time	Complainant	Location of Odor	Description/Rating	Distance from Complaint Location to CBLF *	Direction from Complaint Location to CBLF **	On-site Wind Direction	Comments	Correlation Category
68	11/27/2024	7:15 AM	forwarded from DEQ	(N/A)	"went outside with my cup of coffee. Hit with the smell of the landfill"	(N/A)	(N/A)	S / Calm	South wind (0-1 mph). Winds were calm (0 mph) between 0400 and 0630 hours.	Possible
69	11/30/2024	10:00 AM	forwarded from DEQ	7 miles S of landfill	"sitting at my dest, when I stared to smell it. It lasted for a about 3 hours"	~ 7 miles	N	NNE	North-northeast wind (1 mph). Winds were from the north to northeast between 0000 and 1000 hours.	Possible
70	11/30/2024	12:00 PM	forwarded from DEQ	"passing by the… landfill"	"a terrible odor that we could smell from our car for about a mile north	~ 0 miles	Various	ENE	East-northeast wind (1 mph).	Possible
71	12/1/2024	8:30 AM	forwarded from DEQ	Soap Creek/Writsman Brook	"some sort of chemical", "rotten garbage"	~ 3.7 miles	NE	Calm	South-southwest wind (0 mph). Wind was calm (0 mph) between 0200 and 0830 hours.	Not likely
72	12/1/2024	10:00 AM	forwarded from DEQ	"near Coffin Butte"	"odor is so bad"	~ 0 miles	Various	SSW	South-southwest wind (1 mph). Wind was calm (0 mph) between 0200 and 0930 hours.	Possible
73	12/1/2024	10:00 AM	forwarded from DEQ	(N/A)	"sometimes unbearable"	(N/A)	(N/A)	SSW	South-southwest wind (1 mph). Wind was calm (0 mph) between 0200 and 0930 hours.	Possible
74	12/1/2024	11:52 AM	forwarded from DEQ	"soap creek valley"	"toxic landfill gases"	~ 3.3 miles	NE	N	North wind (3 mph). Winds were from the south-southwest (0-2 mph) between 1000 and 1130 hours. Possible due to channeling effects of terrain.	Possible
75	12/6/2024	9:45 AM	forwarded from DEQ	(N/A)	"landfill stench"	(N/A)	(N/A)	Calm	North-northeast wind (0 mph). Winds were mainly from the north-northeast (0-4 mph) between 0530 and 1000 hours.	Possible
76	12/14/2024	1:30 PM	forwarded from DEQ	Coffin Butte Road	“like a cross between a putrid low tide and an auto repair garage”.	~ 0 miles	Various	SSW	South-southwest wind (3 mph). Winds were from the south-southwest (0-3 mph) between 1030 and 1330 hours.	Not likely
77	12/20/2024	3:00 PM	forwarded from DEQ	4 miles SSE of the Landfill	"odor" "far worse than usual"	~ 4 miles	NNW	Calm	West wind (0 mph). Winds were from the west (0-4 mph) between 1330 and 1500 hours.	Not likely
78	12/23/2024	09:30 AM-12:30 PM	forwarded from DEQ	(N/A)	“Coffin Butte Landfill is belching landfill gas permeating the air. I was 6.3 miles from the landfill and the stench was very noticeable.”	~ 6.3 miles	(N/A)	Calm / NE	Northeast wind (0-4 mph) during this time period. Winds were calm (0 mph) between 0330 and 1030 hours.	Possible
79	12/23/2024	2:00 PM	Maggie Livesay	7580 NW Mountain View Drive	landfill smell, 5	~ 4.2 miles	N	Calm	Northeast wind (0 mph). Winds were from the northeast (4 mph) at 1200 hours. Winds were calm (0 mph) between 1230 and 1400 hours.	Not likely
80	12/29/2024	9:29 AM	Virginia Scott	"driving past dump"	"stench", "not one type of aroma"	~ 0 miles	Various	SSE	South-southeast wind (2 mph). Winds were calm (0 mph) between 0700 and 0900 hours.	Not likely
81	12/29/2024	9:29 AM & 6:30 PM	forwarded from DEQ	(N/A)	“As I was driving past the Coffin Butte dump on Coffin Butte Road in Benton County, OR on Sunday morning the stench was so strong that I has to put the car's air on recirculate until I was well north of the dump. It was equally as terrible on my return trip past the dump at about 6:30 PM on 12/29/24 and was smelly even on recirculate well past the Tampico/Soap Creek intersection. This is an issue because on moist days, like Sunday, when the car air is on recirculate, the car windows fog up which makes it dangerous to turn onto Hwy 99.”	Various	Various	SSE / S	South-southeast wind (2 mph) at 0930 hours. South wind (2 mph) at 1830 hours.	Likely

Comparison of CBLF Odor Complaints to On-site Wind Data

Odor Event ID	Odor Event Date	Odor Event Time	Complainant	Location of Odor	Description/Rating	Distance from Complaint Location to CBLF *	Direction from Complaint Location to CBLF **	On-site Wind Direction	Comments	Correlation Category
82	12/29/2024	4:45 PM	forwarded from DEQ	(N/A)	“Almost every evening to early morning there is a strong methane odor originating from the Coffin Butte Landfill located north of Corvallis in Benton County Oregon. This year the odor has become strong enough to smell indoors if an air filter isn't in use. There is also a tremendous amount of litter and garbage along Camp Adair Road, Hwy 99 and other tributary roads leading to the landfill. The garbage is on the roads, in the ditches soaking in water and leaching into the ground. The air and material pollution is a hazard to humans, wildlife and plant life in the local area. There is no telling what chemicals and hazardous materials are contaminating the local biosphere.”	(N/A)	(N/A)	S	South wind (2 mph).	Possible
83	12/31/2024	3:45 PM	forwarded from DEQ	(N/A)	“Coffin butte landfill is releasing methane gas and stink into the atmosphere. The stink is becoming worse each day. I don't have enough time to notify you each day of the occurrence but it is becoming much more frequent, approximately 5 days a week now.”	(N/A)	(N/A)	S	South wind (2-3 mph).	Possible
84	1/1/2025	12:00 AM	forwarded from DEQ	(N/A)	“The Coffin Butte Landfill stench was wafting through the air. Landfill gasses 5 miles from the Landfill. Very strong odor”	~ 5 miles	(N/A)	SW	Southwest wind (1 mph).	Possible

Ethyl mercaptan (ethanethiol) - VOC	3.97E-01	7.93E+02	1.98E+02	5.95E+00	5.95E+00
Methyl mercaptan - VOC	3.34E-01	6.67E+02	1.67E+02	5.01E+00	5.01E+00
Pentane - VOC	6.61E-01	1.32E+03	3.30E+02	9.91E+00	9.91E+00
Propane - VOC	1.35E+00	2.69E+03	6.73E+02	2.02E+01	2.02E+01

Notes:

* Fugitive emissions assumed 75% gas collection and 25% fugitive loss.

** Flare emissions assumed 98% destruction of the 75% gas collection, then a 50% / 50% split for Open Flare 1 and Open Flare 2.

Appendix D

Memorandum

To: Benton County Planning Commission

From: Jeffrey G. Condit

Subject: Response to May 5, 2025, Memorandum from Jeffrey L. Kleinman
File No. LU-24-027

Date: June 6, 2025

As you know, we represent Valley Landfills, Inc. ("VLI"), the applicant for the above-noted conditional use permit application (CUP). This memorandum responds to the above-noted memorandum prepared by Jeff Kleinman, attorney for Valley Neighbors for Environmental Quality and Safety.

I. Response to Mr. Kleinman's Sections I and II (Introduction and General Comments)

A. New Landfill. Mr. Kleinman argues that this CUP for expansion of the landfill should be treated as an application for a new landfill. That is not a plausible interpretation. The proposed expansion is on land specifically designated for landfill use, for which zoning was adopted with the intention of providing for future expansion of the landfill. A landfill has been operating in this area for 70 years, and the expansion area will be part of the landfill operation that includes areas north of Coffin Butte Road.

B. Conditions of Approval. VLI respectfully disagrees with the representation that it has a track record of noncompliance with conditions of approval or that Benton County (the "County") will not enforce conditions. The decisional record from 1973 through 1990 is not complete and is prior to Republic's ownership, so VLI also has limited records from this period. In the proposed conditions of approval, there are conditions that must be completed to the County's satisfaction during development before VLI can move onto the next phase. There are also operating conditions that continue to apply to the landfill after operations begin, such as maintenance of the vegetative screen and odor and noise monitoring and mitigation. If VLI fails to comply with these conditions, the County can bring an enforcement action against VLI up to and including revocation of the CUP. The proposed conditions are consistent with the County's

modern practice and provide plenty of teeth to ensure that VLI will continue to comply with any conditions of approval imposed by the County.

C. Benton County Talks Trash (BCTT). VLI agrees that the BCTT final report is not a binding legal document; it is, however, a highly persuasive resource. Multiple stakeholders spent months going over the history and legal framework of the landfill and produced a BCTT final report with significant (if not total) consensus. Mr. Kleiman argued at the May 6 hearing that the Planning Commission should ignore the analyses by the BCTT legal subcommittee because it included the County counsel and two attorneys for VLI. We note that Mr. Kleinman was invited to participate by Sam Imperati, the Oregon Solutions moderator, and Mr. Kleinman declined. As a result, Mr. Imperati retained former LUBA member and long-time land use lawyer Virginia Lucker to serve as the Committee's member on the legal subcommittee to ensure that the final report represented views coming from multiple perspectives. The consensus work product of the legal subcommittee included Ms. Lucker's substantive input and conclusions.

D. Past Representations About the Landfill. Mr. Kleinman and several persons testifying at the hearings argued that "promises were made" 50 years ago that the landfill would be temporary or would close after a certain period. We reiterate that the only applicable criteria are those in the current County land use regulations. *See, e.g.*, *M & T Partners, Inc. v. City of Salem*, ___ Or LUBA ___ (LUBA No. 2018-143) (Aug. 14, 2019) (oral and written representations by the applicant that the commercial shopping center uses allowed under a comprehensive plan and zone change would not include a Costco store did not support denial of a subsequent application including a Costco, where that restriction was not incorporated into the zone change and the Costco otherwise complied with the adopted requirements of the zone).

II. Response to Mr. Kleinman's Section III (Conditional Use Approval Standards)

A. Meaning of "Seriously Interfere" under BCC 53.215(1). Mr. Kleinman appears to argue that any interference that is more than insignificant is serious. That is not consistent with the express language of the Benton County Development Code. The interpretation that VLI proposed in its Burden of Proof, and with which staff concurred in the Staff Report, was based upon the BCTT analysis. That analysis was based not just on the input from the lawyers, but primarily on research by County planning staff about how the County has historically interpreted the conditional use criteria in past land use decisions. The Planning Commission should bear in mind that the conditional use criteria in BCC 53.215 apply to all conditional uses

under the Benton Development Code. If the County adopts a much more restrictive definition with regard to this application, then the County will have to apply that interpretation in any future CUP application for any conditional use in the Code. If the County adopts a more restrictive interpretation for this application than its historic interpretation, that affects the plausibility of the interpretation. If the County adopts a more restrictive interpretation for the application and then reverts to its historic interpretation in future applications, that is a due process issue. As an applicant, VLI expects to be judged based upon the text of Code and consistent the County's past practice.

Mr. Kleinman's construction of the term "significant" is not relevant because that term is not used in BCC 53.215(1).

B. Interference with Uses on Adjacent Property. BCC 53.215(1) requires an analysis of the impacts on adjacent property and on the character of the area. VLI identified the adjacent properties based upon the definition of "adjacent" in Webster's Third New International Dictionary, which, as Mr. Kleinman notes, is the dictionary preferred by LUBA and the appellate courts when construing terms of common usage. *See* BOP at 19-20. VLI identified adjacent properties, not just adjacent to the expansion area, but adjacent to the existing landfill plus the expansion area; VLI also included in its analysis properties abutting the adjacent properties. While VLI does not necessarily agree that this expansive view of "adjacent" is required by the Benton County Code, the Staff Report concurs that this captures all of the "adjacent properties."

1. Noise. As part of its post-hearing submittal, VLI has submitted an revised Odor Modeling Study dated June 2025 ("June 2025 Noise Analysis") to address the concerns in the Staff Report that led to staff's recommendations for denial and to recommend additional mitigation measures.

a. DEQ Noise Rule. Mr. Kleinman implies the DEQ Noise Control Regulations for Industry and Commerce (OAR 340-035-0035) (the "Noise Rule") are unenforceable and out of date. DEQ does not enforce its noise control regulations because the legislature withdrew DEQ's funding to do so. *See* OAR 340-035-0110. The Noise Rule has been updated since 1991, however, and is applied by cities, counties, and other state agencies in other contexts. *See, e.g.*, *Mingo v. Morrow Cnty.*, ____ Or LUBA ____ (LUBA Nos. 2011-014, 2011-016, and 2011-017) (June 1, 2011) ("*Mingo I*") (wind energy facility noise). The

Noise Rule is an accepted benchmark for determining noise impacts on surrounding properties, particularly in the absence of any County noise rules.

b. Back-Up Beepers. Mr. Kleinman argues that the proximity alarms that will be installed on VLI's vehicles instead of back-up beepers are even noisier. Mr. Kleinman cites no evidence in support of this allegation. VLI is actually proposing to install ambient-sensing broadband back-up alarms that use white noise that adjusts based upon ambient sound levels. These are much quieter than tonal alarms. June 2025 Noise Analysis.

2. Odor. As part of its post-hearing submittal, VLI has submitted an updated Odor Analysis to address the concerns in the Staff Report that led to staff's recommendations for denial.

3. Methane. Methane emissions are regulated by the EPA. VLI is fully cooperating with the EPA's Section 114 Information Request.

4. Visual Impacts. VLI relies on its analysis in the BOP and the staff analysis. The closed landfill cells will be reclaimed and revegetated over time. VLI has submitted additional testimony addressing the alleged "patchwork of decaying tarps" as part of its June 6, 2025, response to the hearing testimony. VLI has also submitted additional information about the height of the proposed expansion area. It will be below the height of Tampico Ridge at all points and will not be visible from the south side of the ridge

C. The Character of the Area. VLI relies on the arguments in its BOP.

D. 2021 Decision Findings. Mr. Kleinman cites to several findings from the Planning Commission's 2021 decision in support of denying this application. As Mr. Kleinman himself notes, the 2021 application was a substantially different application with a substantially different evidentiary record. Those findings are not relevant to this application.[1]

[1] Mr. Kleinman posits that this application is a "Trojan Horse" for the eventual closure of Coffin Butte Road and the filling in of the valley: "it is not inconceivable that the county would apply (to itself) to vacate Coffin Butte Road so that Republic would own and could fill over the right-of-way." In point of fact, any future expansion of the landfill would require a CUP process subject to the same criteria, public notice, and process as the existing application, and any concomitant vacation requires an official action of the County Board of Commissioners, even under the expedited process when all of the abutting property owners consent. *See* ORS 368.351, 368.356. Approval of this application would not affect the required process applicable to any future application or make it any easier.

E. The Purpose of the Forest Conservation (FC) Zone. Mr. Kleinman's argument that the purpose of the FC zone prohibits landfill use on FC-zoned lands ignores two express provisions in Chapter 60. Section 60.005 (Purpose of the Zone) describes forest-related uses and then goes on to say:

> Except for activities permitted or allowed as a conditional use, non-forest uses shall be prohibited in order to minimize conflicts with forest uses, reduce potential for wildfire, and protect this area as the primary timber producing area of the County.

BCC 60.215(11) expressly allows as a conditional use in the FC Zone:

> Disposal site for solid waste approved by the Benton County Board of Commissioners and the Oregon Department of Environmental Quality together with equipment, facilities, or buildings necessary for its operation.

Mr. Kleinman's argument is directly contrary to the express language of the Code.

III. Response to Mr. Kleinman's Section IV (Conditions Related to Traffic, Drainage, Leachate Management)

A. Traffic. VLI's traffic consultant has responded to testimony at the hearing regarding transportation in a report dated May 23, 2025, and included in its June 6 response to testimony at the hearing. The proposed improvements to Coffin Butte Road are more than sufficient to address the changes in truck and traffic patterns and will not impede through traffic on Coffin Butte Road.

B. Drainage and Leachate Management. Mr. Kleiman does not explain why he believes VLI's responses to drainage and leachate management are not compliant. VLI has submitted additional evidence into the record in response to testimony at the hearing about drainage/groundwater, leachate, and proposed construction. Typically, construction activity to site a proposed use is not considered part of the impact for conditional use review.[2]

IV. Response to Mr. Kleiman's Section V (Conditional Use Criteria Under BCC 60.220)

Staff correctly concluded that VLI has demonstrated compliance with these criteria. If the application is approved, the working face of landfill will move from the north side of Coffin Butte Road to the expansion area, but the overall off-site impacts will not be materially

[2] For example, OAR 340-035-0035(5)(g) exempts construction site noise from compliance with the Noise Rule.

different. As noted in VLI's BOP, farm and forest uses have thrived on adjacent properties, including the farm uses on VLI's properties directly adjacent to the landfill.

V. Response to Mr. Kleinman's Section VI (Development Activities in Wetlands)

Nothing in BCC 99.225 requires an applicant to obtain wetland permits prior to approval of a land use application or require an agency response before approval. None of the wetlands identified on site are a designated Goal 5 wetland under the County Comprehensive Plan or land use regulations, and so the County does not have any independent regulatory authority over any of the wetlands on site. The Draft Conditions of Approval (PA-1) require VLI to obtain an approved wetlands delineation and any necessary removal/fill permits prior to any ground-disturbing activities, as required by state and federal law.

VI. Conclusion

VLI has met its burden for proof to demonstrate compliance with the applicable criteria and respectfully requests that the Planning Commission approve the above-noted application.

1.0 INTRODUCTION

The Coffin Butte Landfill (CBLF) is proposing to expand the waste disposal area of the landfill by using an existing property just south of Coffin Butte Road. The goal of this study was to conduct an odor dispersion modeling analysis that compares the existing and proposed operating scenarios for potential nuisance odor impacts. Since odor is a subjective human response, odor dispersion modeling was used to provide an objective approach towards understanding how on-site emissions of odor potentially impact off-site locations.

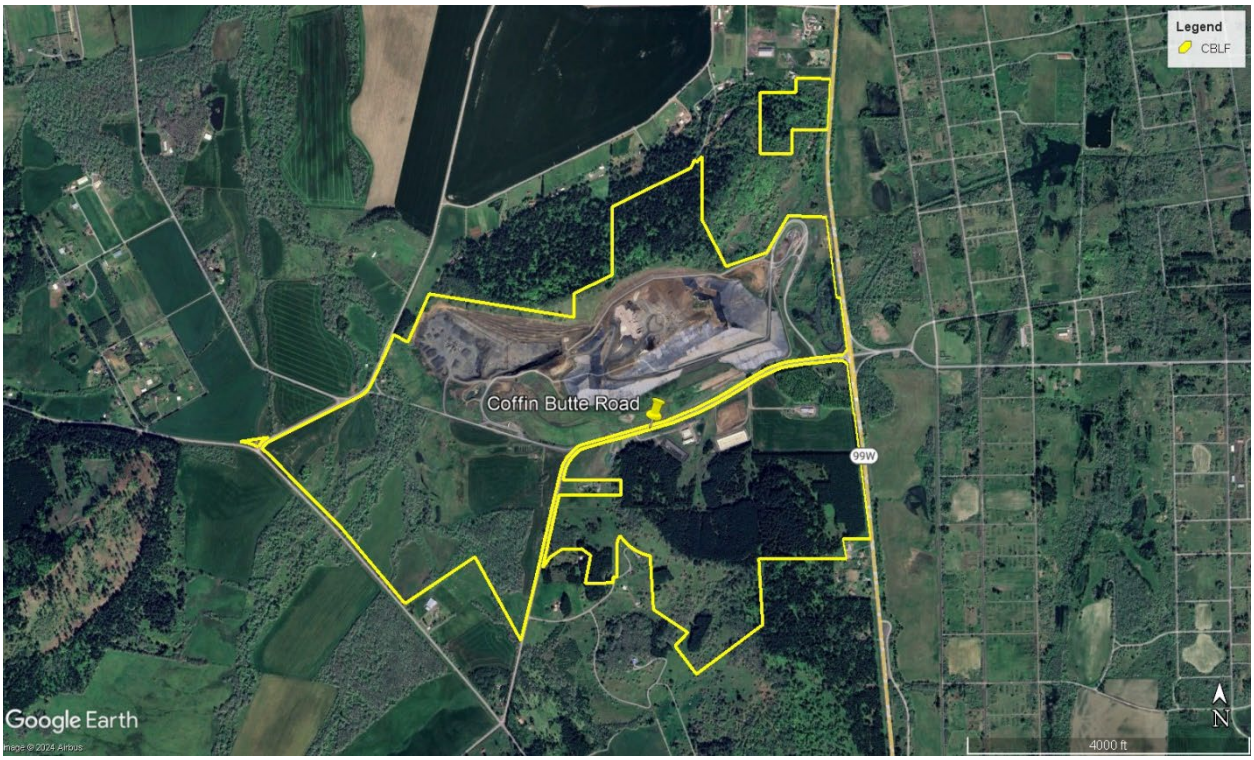
Following this Introduction, Section 2 provides a description of the facility. Section 3 describes the methodology used in this study while Section 4 summarizes the results. Section 5 then presents the conclusions. Finally, the appendices provide supporting documentation.

2.0 FACILITY DESCRIPTION

2.1 LOCATION

The CBLF is located at 28972 Coffin Butte Road in Corvallis, Oregon (Benton County). The facility is located just west of Highway 99W, approximately nine miles north of downtown Corvallis. Coffin Butte Road runs through the facility. See Figure 1 for the CBLF property boundary [1].

Figure 1. Facility Location

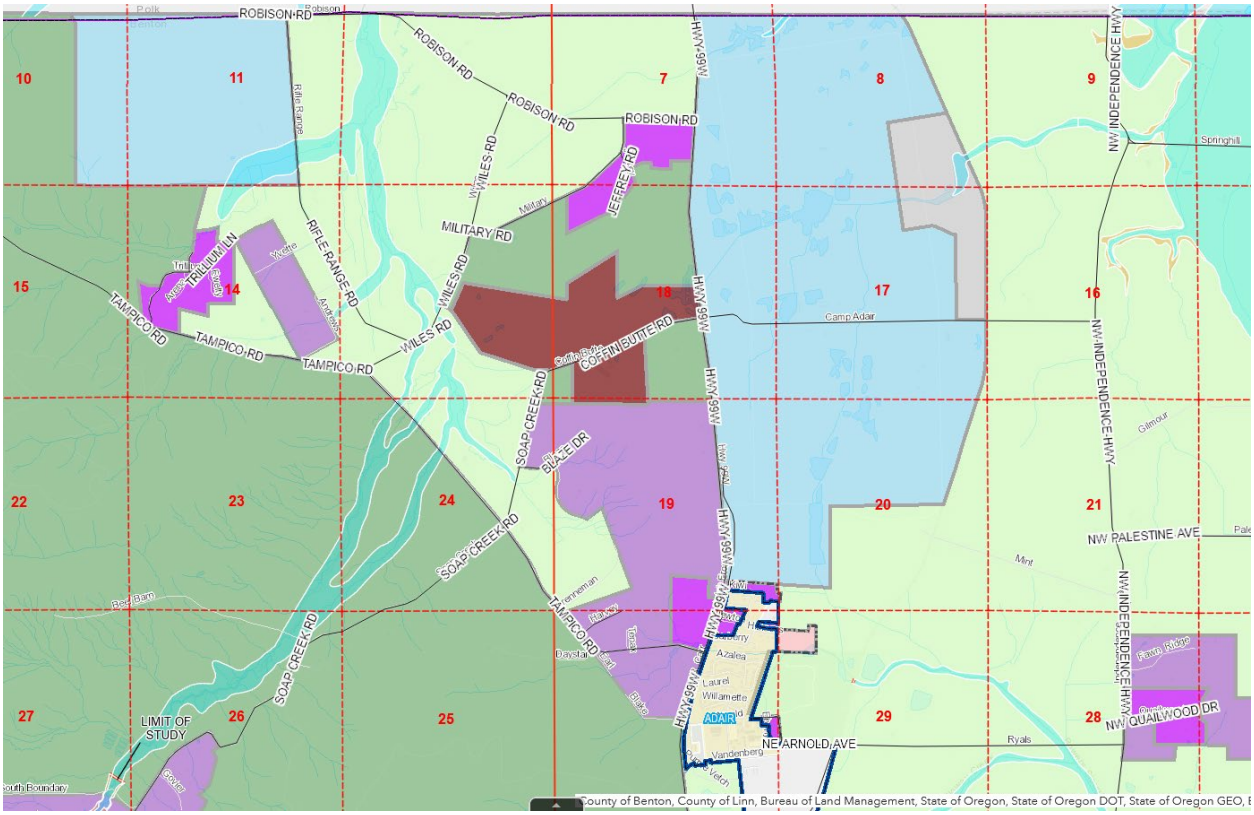


Note: Google Earth imagery from April 18, 2024.

2.2 LOCAL LAND USE / ZONING

Local land usage impacts air dispersion as surface characteristics differ for rural and urban conditions. Local land use near the CBLF is rural based upon the zoning map in Figure 2 [2].

Figure 2. Local Zoning Map



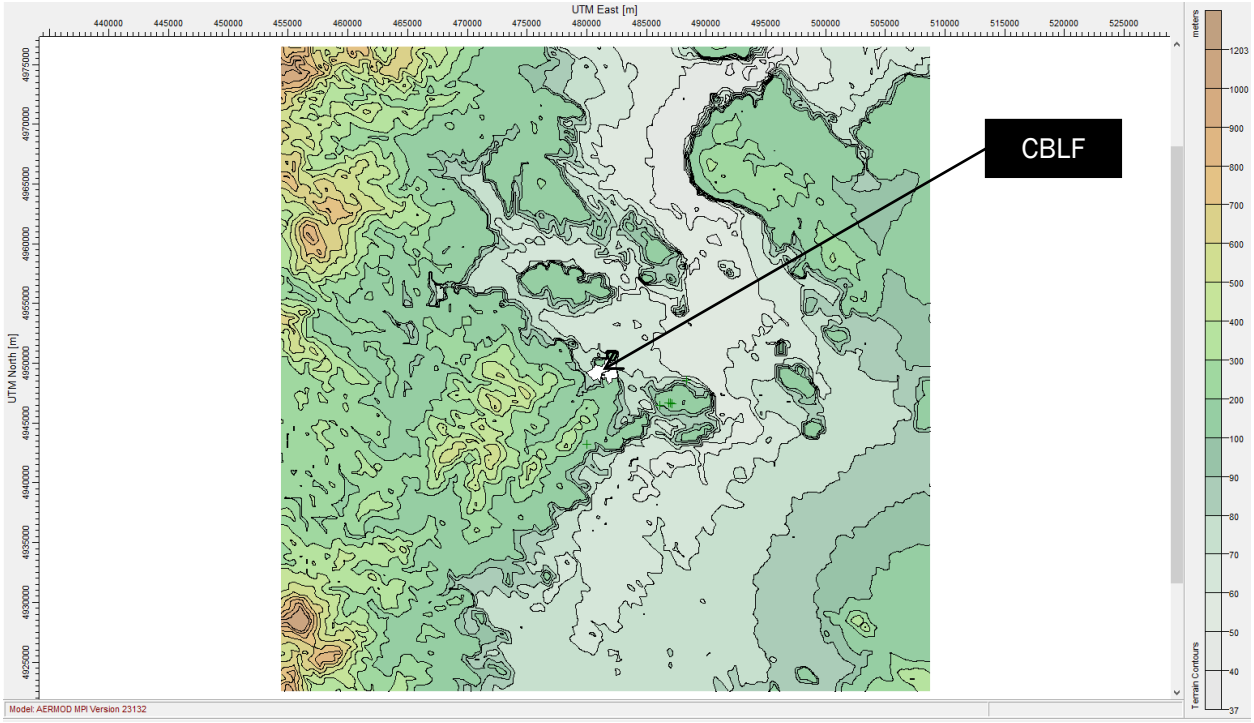
Zoning Color Code Legend:

- Exclusive farm use (light green);
- Forest conservation (green);
- Landfill (brown);
- Open space (light blue);
- Rural residential – 5 acre minimum parcel or lot size (magenta); and
- Rural residential – 10 acre minimum parcel or lot size (light magenta).

2.3 TERRAIN / TOPOGRAPHY

Local terrain also impacts air dispersion as winds can be channeled when flowing through canyons and valleys. In this case, the CBLF is located along the western edge of the Willamette Valley. See Figure 3 for the elevation contours surrounding the landfill [3].

Figure 3. Elevation Contour Map



2.4 CLIMATE AND METEOROLOGY

Local air quality is also impacted by the regional climate and meteorology as weather conditions control the transport and diffusion of emitted pollutants downwind from the release point into the surrounding area. Climate deals with long-term weather patterns while meteorology deals with short-term daily and hourly weather conditions. Nuisance odors are more likely to occur under poor meteorological conditions (e.g., low wind speed and stable wind conditions) that are common in the late night and early morning hours.

2.5 POTENTIAL ODOR ACTIVITIES

CBLF accepts commercial and public solid waste. The waste is placed in layers at the working face, compacted by heavy equipment, and then covered daily. Once an area of the CBLF has reached capacity, it is eventually capped with final cover to minimize infiltration of precipitation and release of gases not captured by the landfill gas collection and control system (GCCS). Odor is potentially emitted from sources such as:

- working face;
- tippers;
- leachate (i.e., water that has passed through the landfill's layers);
- landfill gas (LFG) which is a natural byproduct of decomposing organic material; and
- flares which burn any excess LFG collected by the CBLF.

Flares conservatively combust 98% of LFG sent to them. The 2% of un-combusted odor constituents in LFG is modeled for odors.

2.6 ODOR MONITORING AND CONTROL MEASURES

CBLF has developed and implemented a site-specific odor management plan that includes:

- application of daily cover;
- operating a LFG collection and control system;
- conducting surface emissions monitoring (SEM);
- monitoring local weather conditions (temperature, wind direction, etc.);
- conducting routine odor patrol inspections;
- responding to odor complaints received from the public and/or the Oregon Department of Environmental Quality (DEQ);
- taking action when odors are detected/reported;
- observing the area of concern for smell and conditions;
- inspecting landfill operations for any unusual activities or conditions;
- identifying possible sources of odor; and
- confirming implementation of applicable odor minimization measures.

2.7 ODOR COMPLAINT HISTORY

CBLF maintains a log of odor complaints received from the public and the DEQ. For this study, SCS Engineers (SCS) reviewed the odor complaints from 2022 through 2024 for potential patterns (e.g., time of day, day of week, season of year) as well as potential correlation to concurrent wind conditions measured on-site. For review purposes, each odor complaint log entry (event) was assigned a unique ID (1 through 84) as well as an estimated distance and wind direction from CBLF (e.g., if a complaint location was southeast (SE) of CBLF, then the concurrent wind direction at CBLF would need to be northwest (NW) for correlation). Note, odor event #1 (25 odor complaints between 11/18/21 and 2/7/22) could not be categorized since specific complaint dates/times were not provided.

Based upon the review, the following observations were made:

- Location
    - Complaint locations ranged from the adjacent surrounding area to approximately seven miles from CBLF.
    - Complaint locations varied from not provided to general areas to specific addresses.
    - The most common complaint locations specified were southwest (35%) and south (29%) of CBLF.
    - Complaint locations southwest of CBLF were within a valley whose terrain may be channeling odor from CBLF under certain wind conditions.
    - Populated areas south of CBLF include Adair Village, Lewisburg, and Corvallis.
- Time of Day

    - Odor complaints were reported in 16 different hours of the day.
    - Odor complaints peaked in the morning between 8:00 am and 11:00 am:
        - 7:00 am to 7:59 am (11%);
        - 8:00 am to 8:59 am (12%);
        - 9:00 am to 9:59 am (12%); and
        - 10:00 am to 10:59 am (7%).
- Complaints in a Single Day
    - Two days each had five odor events (1/18/2024 and 2/3/2024).
    - Two days each had four odor events (5/23/2024 and 12/1/2024).
    - Four days each had three odor events (2/10/2024, 2/20/2024, 4/1/2024, and 12/29/2024).
    - Seven days each had two odor events.
    - Thirty nine days each had one odor event.
- Day of Week
    - Odor events were reported on each day of the week and peaked on Thursday:
        - Thursday (20%);
        - Saturday (19%);
        - Friday (17%);
        - Tuesday (14%);
        - Sunday (11%);
        - Wednesday (10%); and
        - Monday (8%).
- Month and Season of the Year
    - The odor events peaked in December with the top four months being:
        - December (24%);
        - February (23%);
        - August (11%); and
        - January (10%).
    - The odor events peaked in the winter:
        - Winter (46%);
        - Fall (24%);
        - Summer (18%); and
        - Spring (12%).
    - Thermal inversions could be a contributing factor to the odor complaints. Radiation from the sun can heat the ground which in turn can warm the air near the Earth's surface. When warm air expands and cools as it rises, air temperature decreases with altitude. However, a thermal inversion occurs when air temperature increases with altitude. There are two kinds of thermal inversions: surface and aloft. Surface inversions can result in poor air quality (e.g., odors) as pollutants are trapped near ground level, dispersing only horizontally within the inversion. Surface inversions are stronger and more common during the winter months when winds are calm, skies are clear, and nights are long. [4, 5] Thermal inversions were not considered when evaluating each individual odor event. Air temperature needs to be measured at different heights to determine if a thermal inversion exists. The on-site meteorological station only collected air temperature data at one height. Any odors trapped within an inversion would still disperse horizontally based upon wind direction..
- Correlation of Odor Complaint to On-Site Wind Data
    - Correlation of odor complaints to on-site wind data took into account several factors including complaint location (distance and direction relative to CBLF), complaint time, and the wind speed/direction at and before the complaint time.

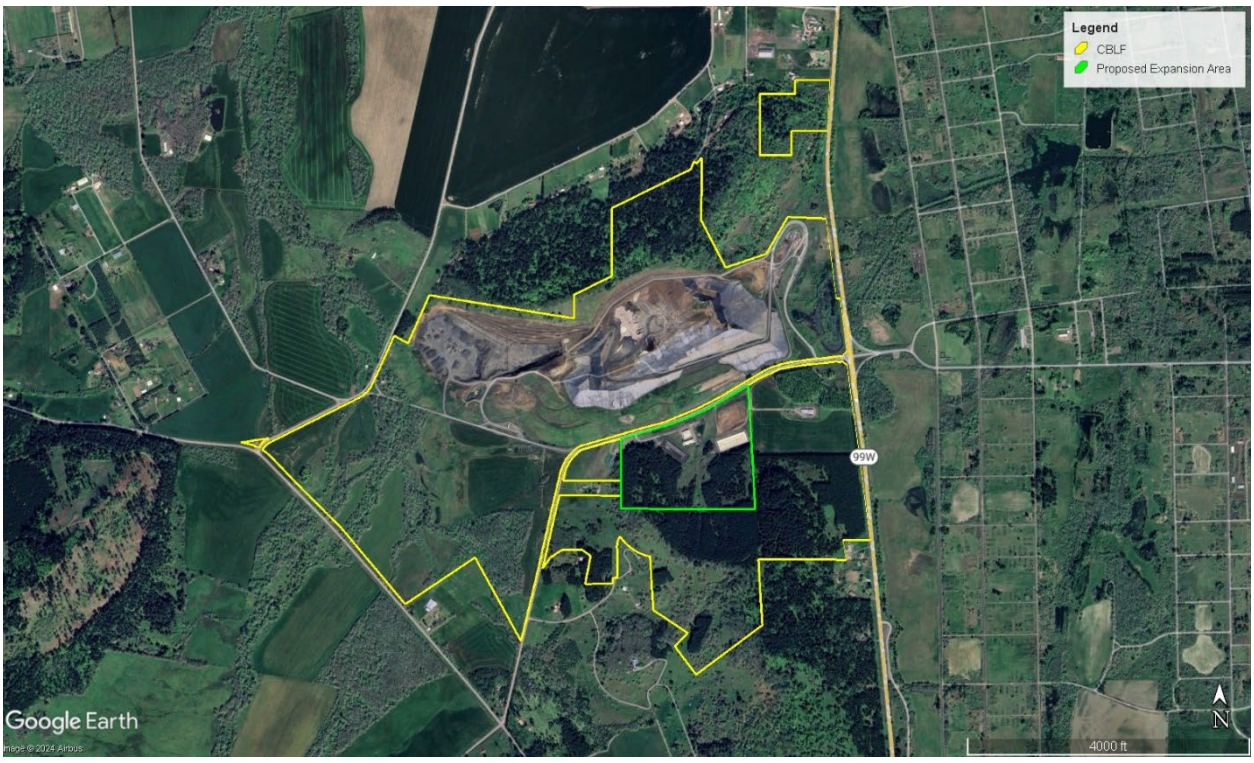
- Odor events were then categorized as follows for correlation:
  - "Likely" based on complaint location and wind conditions (1%);
  - "Not likely" based on complaint location and wind conditions (29%);
  - "Possible" due to ambiguity or lack of data (58%); and
  - "Unknown" due to complaint time not specified (12%).

See Appendix A for the odor complaint review details.

2.8 PROPOSED PROJECT

CBLF is requesting approval of a conditional use permit (CUP) application to expand the area on which landfill activities will be conducted to the south side of Coffin Butte Road (the "Development Site"). In addition to using the Development Site for the landfill, the proposed changes include an 1,800-square-foot employee building and parking on land to the west of the landfill, access road modifications on lands to the north, and the relocation of leachate ponds, leachate loadout, leachate sump, an outbound scale, portions of the perimeter landfill road, the shop/maintenance area, cut activities for landfill, and leachate ponds to support the landfill onto the property to the east (collectively, the "Project") [6]. Figure 4 displays the location of the expansion area in relation to existing operations.

Figure 4. Proposed Expansion Area (Taxlot 104180001107)



2.9 OTHER POTENTIAL SOURCES OF ODOR IN THE REGION

Although this study only addresses potential odor impacts from the CBLF, it is important to note that other potential sources of odor exist in the region including (but not limited to):

- Agriculture.
- Biosolids land application fields (used only in summer months, but not every).
- Compost / organics recycling facility.
- Wastewater treatment plant.

3.0 METHODOLOGY

Since odor is a subjective human response, odor dispersion modeling provides an objective approach towards understanding how on-site emissions of odor potentially impact off-site locations. The following summarizes the methodology used in this study.

3.1 MODEL SELECTION

The American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) (Version 24142 incorporated into the Lakes Environmental AERMOD View 13.0 software suite) [7] was used to model estimated emissions of odorous pollutants from the landfill and predict maximum, off-site, 1-hour concentrations for each pollutant using the rural dispersion mode and elevated terrain.

AERMOD was selected for this study since:

- AERMOD is preferred/recommended by the EPA for near-field dispersion of emissions for distances less than 50 kilometers in both simple and complex terrain.
- AERMOD is acceptable to the DEQ for dispersion modeling studies [8].
- AERMOD has undergone numerous validation studies.
- AERMOD is in the public domain and is readily available.
- AERMOD can model multiple sources and multiple receptors.
- AERMOD can use representative meteorological data to simulate atmospheric conditions that affect the transport and dispersion of air pollution from sources.
- AERMOD can use local terrain data to model receptors in complex terrain.
- AERMOD can be used to model impacts of odor causing pollutants.

Input data for AERMOD included the following which are described below:

- source parameters (locations, dimensions, emission rates, etc.);
- receptor locations;
- meteorological data;
- terrain data; and
- model options.

See below for details regarding the AERMOD model input.

3.2 SCENARIOS MODELED

In order to estimate odors from the landfill at its current state as well as with the proposed expansion, modeling was performed in two scenarios. The first scenario (Scenario #1) modeled actual operations in 2023 using estimated emission rates from the following resources:

- Revised 2023 Annual Title V Report (October 11, 2024) for criteria pollutants using process throughputs and emission factors that have already been approved by DEQ;
- Revised 2023 Air Toxics Emission Inventory (ATEI) (August 2024) for speciated air toxics and Volatile Organic Compounds (VOCs) using process throughputs and emission factors that have already been approved by DEQ; and

- U.S. EPA LandGEM model (LandGEM) ran for the 2023 ATEI for additional non-toxic pollutants not included above assuming an EPA default 75% collection efficiency and 98% destruction efficiency by the flares[1].

The second scenario (Scenario #2) looked at year 2052, which is the estimated closure year if current tonnages of waste acceptance from 2023 continue. 2052 would also see the highest landfill gas generation rate based on the model. A 75 collection efficiency was used in this scenario as well. The estimated waste design capacity will be 41,110,068 tons including the expansion area.

A third scenario was considered to show a middle point in landfill expansion, but is dependent on the odor results of the first two scenarios to see if needed.

3.3 SOURCE PARAMETERS

Source parameters were used to model the release of odorous pollutants from the fugitive landfill surface, landfill gas flares, the tipper engines, and the aggregate insignificant (AI) source. The AI source is incorporated by DEQ into each criteria pollutant emission total for the facility, taking into consideration sources that are too small to be permitted. This includes: cell development, operation and closing; tipping and dump truck drops; leachate collection and wastewater treatment; as well as light plants and trash pumps.

In Scenario #1, the fugitive landfill source was located in the currently permitted waste area North of Coffin Butte Road. In 2023, two open (candlestick) flares were present at the landfill, as well as two tipper engines and the AI source.

Scenario #2 is proposed to include a fugitive landfill source in the current permitted area, as well as an expansion area South of Coffin Butte Road. Since 2023, the two open flares have been replaced with one enclosed flare with a landfill gas capacity of 3,390 standard cubic feet per minute (scfm). For a conservative approach, it is assumed that all landfill gas collected is going through this flare even though a landfill gas to energy (LFGTE) plant is on-site and expected to control a significant amount of the gas. The proposed landfill gas generation rate from LandGEM in 2052 would exceed this flare's capacity, but for simplicity all emissions were still modeled from this flare source, as a second flare with similar exhaust parameters would be installed close by if needed. The tipper engines and AI source parameters were not changed in Scenario #2; however, these sources were moved to the expansion area as the final buildout's active face would likely be in this region. The size of the AI source needed to be shrunk in order to fit in the smaller expansion area.

Tables 1 through 3 summarize the source parameters modeled while Figure 5 displays the modeled source locations. Most model parameters were taken from the November 2024 Modeling Report submitted to DEQ for CBLF. A revised extent of waste was used for the fugitive landfill surface source, with sources in the expansion area estimated based on engineering drawings. The fugitive landfill surface was split into squares as explained in Section 3.3.1.

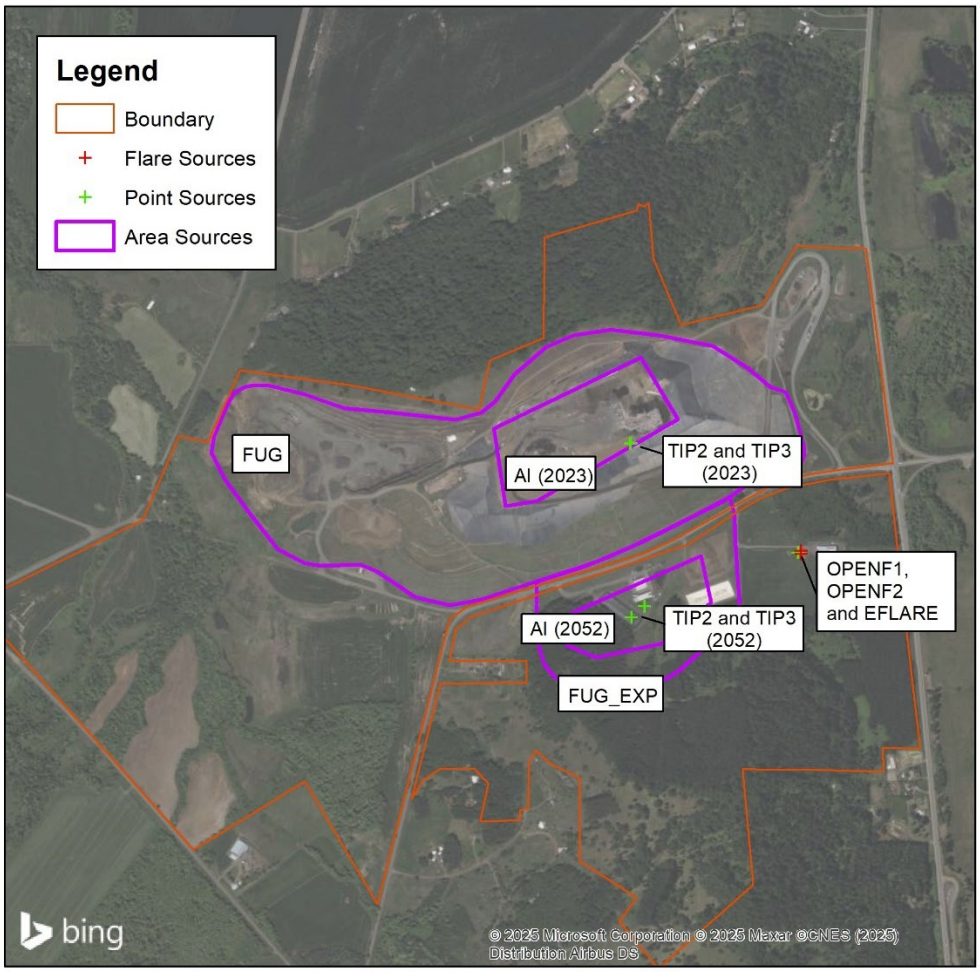
AI (2052)	Aggregate Insignificant	281.6	668,917	0	0

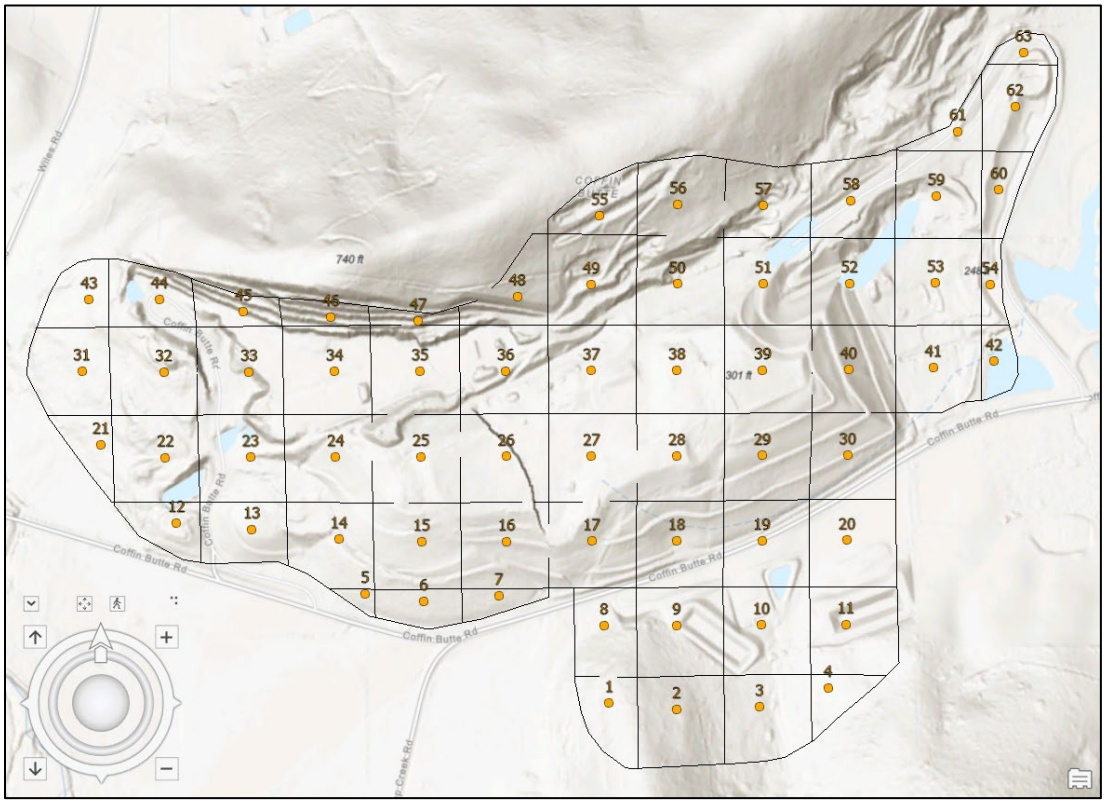
Figure 5. Modeled Area Source Locations



3.3.1 Fugitive Surface Grids

To properly represent the topography of the landfill as flat area sources, the landfill was split up into 20,000 square meter grids. The average elevation of each grid, based on the 2023 and 2052 terrain files discussed in Section 3.7, will be used as the release height of each area source. A base elevation of 246 feet was used, which is the landfill mound's base elevation. See Figure 7 below for a layout of each grid source's location.

Figure 6. Fugitive Source Grids



Grid squares 1 through 4, 8 through 11, 19 and 20 are only added in Scenario #2 as they are in the proposed expansion area, denounced FUG_EXP. Grids 5 through 7, 12 through 18, and 21 through 58 are in both scenarios and denounced FUG. The emission rates for each grid are calculated by taking the total emissions for the area (FUG or FUG_EXP) and dividing by the total number of grids (48 for FUG and 10 for FUG_EXP). Grids 59 through 63 do not contain waste and were removed from modeling.

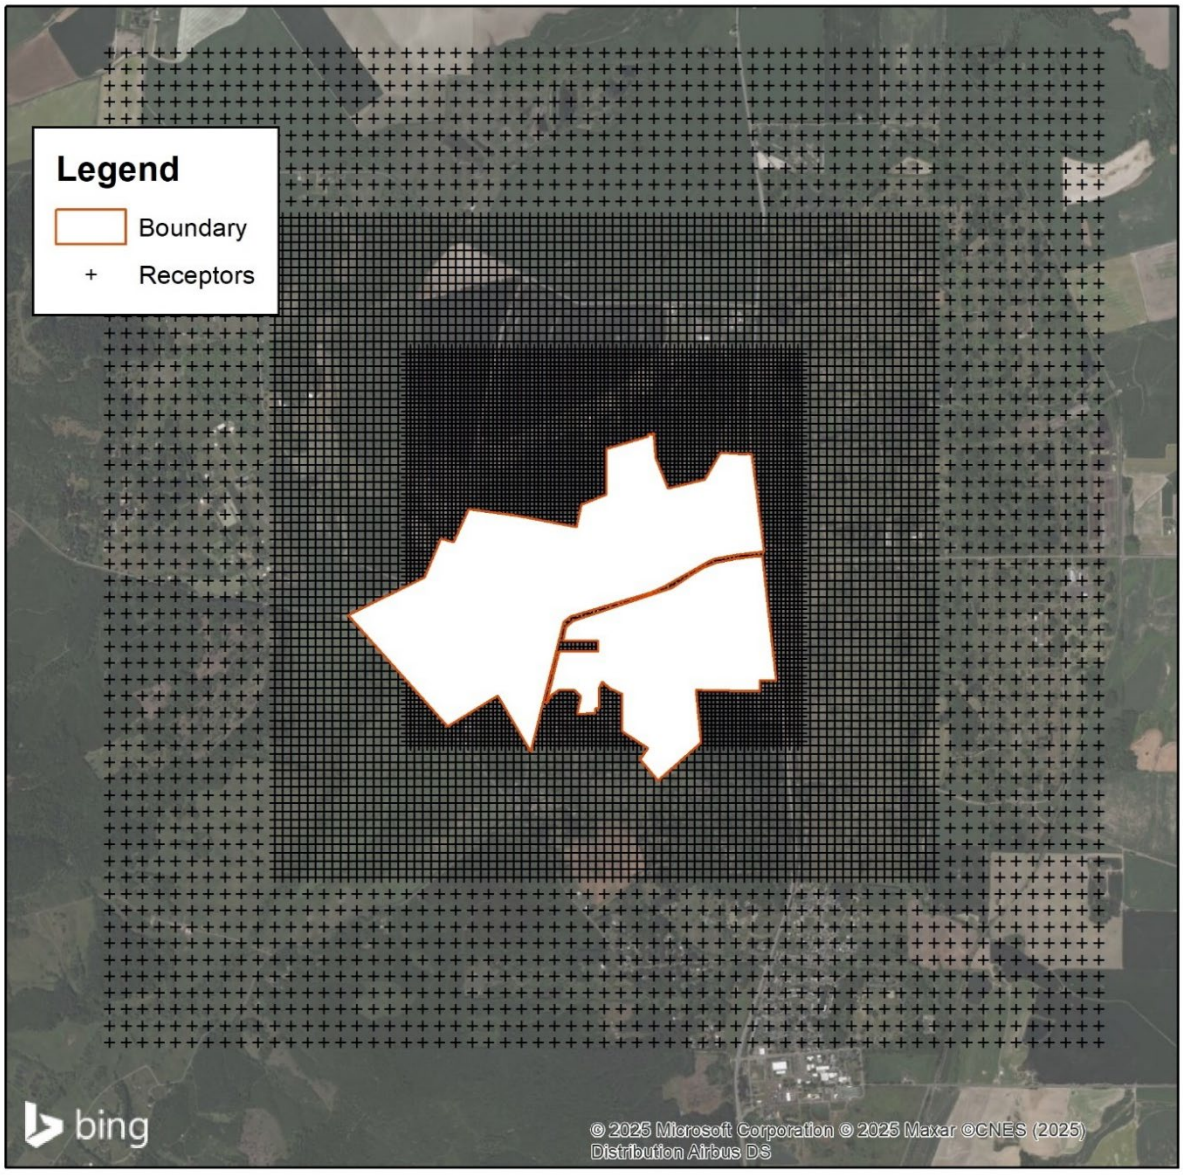
3.4 BUILDING DOWNWASH

Building downwash occurs when wind flowing over/around buildings impacts the dispersion of pollution from nearby stacks (point sources). One building exists 140 feet East of the flares where the LFGTE plant is located. This building is 175 feet by 60 feet wide and 25 feet tall.

3.5 RECEPTORS

AERMOD was used to generate nested 25-meter, 50-meter, and 100-meter spaced receptor grids over the landfill and surrounding area. Receptor flag pole heights were set to zero meters (ground level). On-site receptors within the landfill's property boundary were removed from the analysis. See Figure 6 for the layout of the nested grids.

Figure 7. Nested Receptor Grid



3.6 METEOROLOGICAL DATA

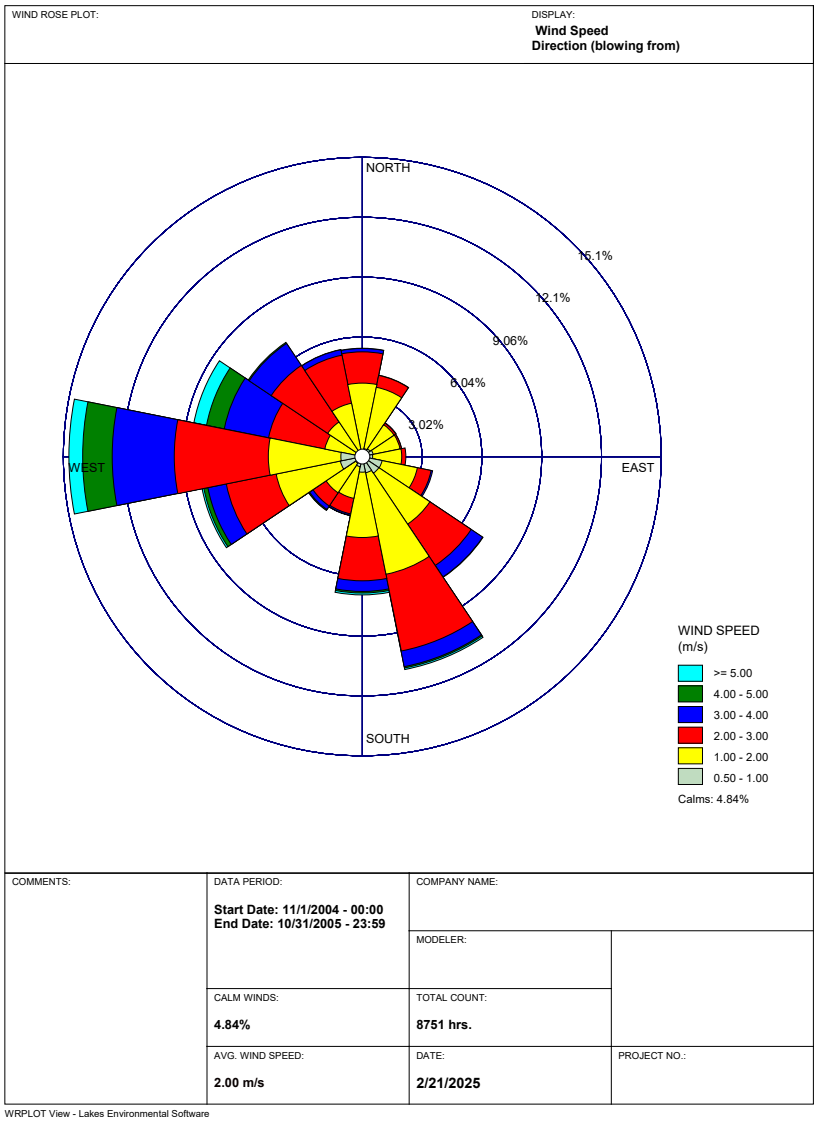
On-site data was collected between November 1, 2004 and October 30, 2005 by CH2M HILL to support permitting for the LFGTE facility (operated by Pacific Northwest Generating Cooperative) expansion which added two additional engines to the facility in 2006. At the time of collection, the meteorological station was located on-site, at a location recommended by DEQ, approximately 100 feet southeast of the LFGTE facility. The data collected from the onsite station included wind speed, wind direction, standard deviation of horizontal wind direction, temperature, delta temperature, and solar radiation. Data for this period is available for 8,727 hours for the year, resulting in a data availability of 99.9%, with greater than 90% availability for any single parameter. Additional details regarding the collected on-site data are available in the 2006 Air Modeling Report prepared by CH2M HILL.

This data set is characterized by strong west-southeast wind pattern. The meteorological data summary was included in the Modeling Protocol approved by DEQ.

The Salem McNary Field was used as the upper air data set. AERSURFACE was used to calculate site specific values for albedo, Bowen ratio, and surface roughness on an annual basis for 12 surface sectors.

A wind rose displays wind speed and wind direction graphically for a designated historical time period. Figure 7 displays the lower altitude (surface) wind rose for the meteorological data modeled in this study for all or model runs. Dominant surface wind patterns occur from the south-southeast and west in this meteorological set. Note, wind data in Figure 7 was measured during a different time period and at a different location than the on-site wind data used for the odor complaint analysis. Therefore, the wind data in Figure 7 was not used in the odor complaint analysis.

Figure 8. Wind Rose of Modeled Meteorological Data



3.7 TERRAIN DATA

Two different sets of terrain data were required to do this analysis: A dataset of current elevations for Scenario #1, and one using estimated final buildout elevations. Current terrain data was downloaded from the United States Geological Survey (USGS) 1 arc-second National Elevation Dataset (NED). Future elevations were determined using engineering renderings at final buildout from AutoCAD. Elevations were then processed and imported into AERMOD for the sources and receptors modeled in each scenario.

3.8 NUISANCE ODOR THRESHOLD

Oregon state laws prohibit businesses from emitting odors which cause a nuisance. These nuisance laws are implemented by the DEQ which has developed a strategy for responding to odor complaints reported through an online tool. The strategy emphasizes early odor detection, voluntary cooperation, and the rapid resolution of nuisance conditions related to odors [9]. Since the DEQ has not specified a protocol for odor evaluations, this study modeled pollutants individually so that predicted off-site concentrations could be directly evaluated against the individual pollutant's published odor detection threshold to determine whether the individual pollutant may be detectable in residential or commercial land use areas. Pollutant-specific odor thresholds were obtained from the following resources [10, 11, 12]:

- American Industrial Hygiene Association (AIHA), "Odor Thresholds for Chemicals with Established Occupational Health Standards, 3rd edition".
- National Oceanic and Atmospheric Administration (NOAA), "Computer-Aided Management of Emergency (CAMEO)".
- United States Environmental Protection Agency (EPA), "Health Effects Notebook for Hazardous Air Pollutants".

Note, many pollutants have a range of published odor thresholds. For this study, the lowest odor threshold published by AIHA was used for most pollutants. For pollutants with wide ranges in odor thresholds (e.g., sulfur based compounds such as hydrogen sulfide), the published odor threshold from CAMEO was used. CAMEO was also used for one pollutant that did not have a published odor threshold from AIHA. Finally, EPA odor thresholds were used for two pollutants that either did not have a published odor threshold from AIHA or had an EPA odor threshold lower than the published odor threshold from AIHA. See Appendix E for the odor thresholds modeled in this study.

Scenario #1 (2023 actual operations) had 49 pollutants with published odor thresholds. Since emission rates and odor thresholds vary by pollutant, the 2023 emissions (taken from the 2023 ATEI as well as non-toxics from LandGEM) were screened for pollutants with the highest potential for causing off-site odors. This was accomplished by ranking each pollutant based on the ratio of facility level emissions (in units of grams per second) to odor threshold (in units of grams per meter cubed). Based upon this screening process, this study focused upon evaluating the following top eight pollutants (approximately 95% of the 2023 odor emissions):

- Dimethyl sulfide (methyl sulfide);
- Ethyl benzene;
- Ethyl mercaptan (ethanethiol);
- Hydrogen sulfide;
- Methyl mercaptan;
- Nitrogen oxides (NOx as NO_2);

- Toluene; and
- Xylenes.

See Appendix B for the odor pollutant screening results.

3.9 SCENARIO EMISSION RATES

Emissions of the eight pollutants with the highest odor potential as mentioned in Section 3.8 were calculated for both Scenario #1 and #2. As mentioned, the estimated actual emissions from 2023 were used for Scenario #1. Hydrogen Sulfide, Xylene, Toluene, and ethyl benzene from this ATEI were directly brought into the model. The only change to sources from the ATEI was the landfill surface, noted as F-LFG1 and F-LFG2, which were combined and modeled as FUG. Dimethyl sulfide, methyl mercaptan, and ethyl mercaptan were taken from LandGEM for the 2023 year, which determined 591.58 MMscf of landfill gas was emitted fugitively and 607.56 MMsf of landfill gas was combusted by the open flares. These three pollutants are only present in the landfill gas sources. Nitrogen oxides (NOx) emissions were taken from the 2023 annual Title V emission calculations reported to DEQ. See Appendix C for Scenario #1 emission rates.

Scenario #2 requires LandGEM to estimate future yearly tonnages until the design capacity is reached. The design capacity is 41,110,068 tons including the expansion area, which will be reached in year 2052 assuming the 2023 waste acceptance of 930,373 tons continues annually. This would generate 1,132 MMscf of fugitive landfill gas and 3,399 MMscf of collected gas in year 2052. The same methodology from Scenario #1 was used to calculate fugitive and flare emissions using the permitted emission factor for NOx of 27.35 lb/MMscf. The total landfill fugitive surface area is 1,011,815 square meters, with 81% of this being in the current area, and 19% in the southern proposed expansion. Total fugitive emissions were split between FUG and FUG_EXP based on this area percentage. See Appendix D for Scenario #2 emission rates for the eight targeted odorous pollutants.

Emissions by source for each scenario are shown in Tables 4 and 5 below.

Table 4. Scenario #1: 2023 Emissions By Source (g/s)

Pollutant	FUG	OPENF1	OPENF2	TIP2	TIP3	AI
Ethyl Benzene	1.06E-02	1.04E-04	1.14E-04			
Hydrogen Sulfide	2.63E-02	2.57E-04	2.82E-04			
Toluene	7.86E-02	7.70E-04	8.45E-04	8.12E-05	6.26E-05	
Xylene	2.79E-02	2.73E-04	3.00E-04	5.66E-05	4.36E-05	
Dimethyl Sulfide	9.67E-03	2.90E-04	2.90E-04			
Ethyl Mercaptan	2.85E-03	8.56E-05	8.56E-05			
Methyl Mercaptan	2.40E-03	7.20E-05	7.20E-05			
Nitrogen Oxides		9.15E-02	1.71E-01	8.79E-01	6.77E-01	2.88E-02

4.0 RESULTS

Tables 6 and 7 summarize the peak, off-site, 1-hour pollutant concentrations for each modeling scenario in units of micrograms per meter cubed (ug/m3). Each pollutant impact was then compared to its odor threshold via a ratio called dilution to threshold or D/T (i.e., maximum impact divided by odor threshold). A D/T ratio of one indicates that roughly half of people can detect an odor at a given location for a given hour. A D/T of 7 is expected to result in a odor "nuisance" in most states, though this number is variable and not quantified in Oregon. See Figure 8 for the peak, off-site impact locations. Figures 9 through Figure 12 show the odor concentration contours from the two pollutants in each scenario with the highest D/T values. For each scenario, NOx had the highest D/T with the tipper engines as driving sources, and dimethyl sulfide had the highest D/T with the fugitive landfill surface as the driving source. All six of the remaining pollutants would show similar contours to dimethyl sulfide as they have the same driving source.

Table 6. Scenario #1: 2023 Model Results

Odor Pollutant	Max Impact (ug/m3)	Odor Threshold (ug/m3)	Max D/T	Driving Source	Max Impact Easting UTM Zone 10 (m)	Max Impact Northing UTM Zone 10 (m)
Dimethyl sulfide (methyl sulfide)	**3.51**	**2.54**	**1.38**	**FUG**	**481,595**	**4,949,280**
Ethyl benzene	3.85	8.68	0.44	FUG	481,595	4,949,280
Ethyl mercaptan (ethanethiol)	1.03	2.54	0.41	FUG	481,595	4,949,280
Hydrogen sulfide	**9.52**	**6.55**	**1.45**	**FUG**	**481,595**	**4,949,280**
Methyl mercaptan	0.87	4.13	0.21	FUG	481,595	4,949,280
NOx (as NO2)	769.18	1,881.62	0.41	TIP2 and TIP3	481,845	4,950,455

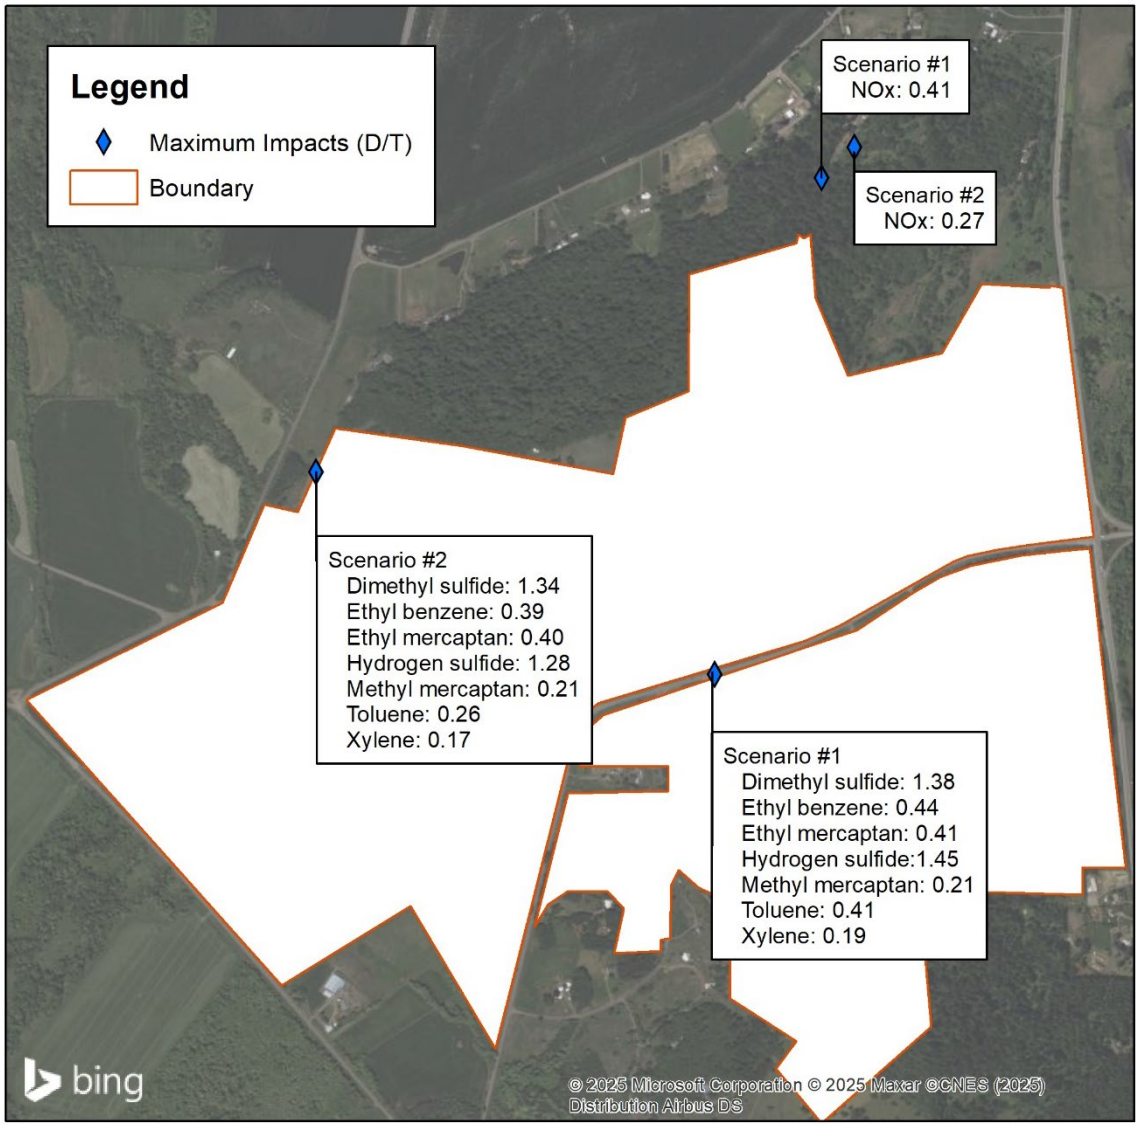
Figure 9. Peak 1-Hour Off-site Odor Impact Locations



Odor pollutants individually exceeded a D/T value of 1 for both hydrogen sulfide and dimethyl sulfide in this analysis. This is potentially detectable, but far below nuisance levels. However, there appears to be no significant change in odor impact from Scenario #1 to Scenario #2. Landfill gas generation from the landfill is expected to significantly increase from 2023 to 2052, increasing odor pollutants, however the landfill will be higher in elevation at that time which helps with dispersion. Scenario #1 shows the higher impacts from Nox as relocating the tipper engines and AI source to the southern expansion area is much better for modeling, having a larger buffer to the North and being at a lower elevation.

Based on the odor results in Scenario #1 and #2, a third scenario in the middle of expansion does not seem necessary. This middle scenario would show results in between Scenario #1 and #2 with slight differences based on landfill mound height in the expansion area and would certainly show D/T values less than 1 for all pollutants.

5.0 CONCLUSIONS AND UNCERTAINTY ANALYSIS

Conclusions for both odor modeling and complaint analyses are described below. In addition, a discussion on uncertainty in this report is detailed in Section 5.3

5.1 MODELING CONCLUSIONS

Since DEQ has not specified a protocol for odor evaluations, this study modeled pollutants individually so that predicted off-site concentrations could be directly evaluated against the individual pollutant's published odor detection threshold to determine whether the individual pollutant may be detectable in residential or commercial land use areas. This evaluation was accomplished using a D/T ratio for each pollutant modeled (i.e., maximum 1-hour pollutant concentration modeled divided by its odor threshold).

Based upon the modeling results of the two scenarios, the following conclusions are presented:

- Peak, off-site, 1-hour pollutant concentrations for Scenario #1 (2023 actual operations) showed hydrogen sulfide and dimethyl sulfide slightly over the detection threshold, but not nearly at nuisance levels.
- Peak, off-site, 1-hour pollutant concentrations for Scenario #2 (2052 proposed operations) also showed hydrogen sulfide and dimethyl sulfide slightly over the detection threshold, but not nearly at nuisance levels.
- Peak, off-site, 1-hour pollutant concentrations for Scenario #2 (2052 proposed operations) showed no significant change in odor impacts compared to Scenario #1 (2023 actual operation) for all pollutants except NOx. The decrease in NOx impact was due to the change in tipper and AI location, with an increase in all other pollutants based on increased landfill gas generation.
- Peak impact locations were all north of the landfill boundary for NOx in Scenario #1 and Scenario #2. Landfill gas odor constituents were highest on Coffin Butte Road in Scenario #1 and on the Northwest property boundary in Scenario #2.
- Moving operations to the proposed expansion area will move the predicted peak, off-site 1-hour impact locations, but impacts would remain below the nuisance levels for all pollutants.

Typically, odors become a nuisance at or above 7 D/T [13, 14]. Therefore, this study concludes that the proposed expansion Project will not cause detectable off-site nuisance odor impacts at nearby residential or commercial areas.

5.2 ODOR COMPLAINT CONCLUSIONS

The odor complaint analysis for complaints logged in 2022 through 2024 indicated the following conclusions:

- Complaint locations ranged from adjacent to CBLF to as far as seven miles away.
- Most complaints were located Southwest and South of CBLF, requiring wind from the North or Northeast to be coming from the landfill.
- Dominant wind patterns come from the South-Southeast and West based on the meteorological dataset.
- Complaints peaked in the morning from 8:00 AM to 11:00 AM.
- Complaints specifically peaked in winter months, possibly due to thermal inversions. Colder temperatures have less thermal mixing which leads to higher air quality and odor impacts.

- Correlating the complaint location to wind data during the complaint time showed only 1% of complaints "likely" to come from the landfill and 58% to be "possible" from the landfill.

5.3 UNCERTAINTY ANALYSIS

Odor modeling is inherently complex and subjective, leading to significant uncertainty. The model performed to average emission rates and ran them over hour averages of on-site meteorological data for a whole year from November 1st 2004 through October 31st 2005. The maximum hourly impact at each off-site receptor was presented, but does not take into account shorter term (less than 1 hour) timeframes when odor concentrations could be higher with the right meteorological conditions. In addition, AERMOD has limitations at low wind speeds and is not able to model thermal inversions which could be present around CBLF.

In addition, the odor detection thresholds for each pollutant are highly varied depending on the person. In general, these odor thresholds are based on a concentration where half of the general public is able to detect the smell at a specific time and location. Certain odorous chemicals can also have an additive effect, where their smells are similar enough that the concentrations of each constituent can be added to compare to a detection threshold. During a February 2025 meeting with SCS and the County's consultants, it was agreed to model pollutants individually so that predicted off-site concentrations could be directly evaluated against the individual pollutant's published odor detection threshold to determine whether the individual pollutant may be detectable in residential or commercial land use areas. However, even when considering an additive effect, the D/T remains below 7 for the top five pollutants summed together.

These limitations have the potential to underpredict odor concentrations. It is possible for odors to be detectible by people that are sensitive to particular odors, especially in low wind or thermal inversion conditions.

Uncertainty is also present in the odor complaint review. The time recorded for the complaint does not necessarily line up with the timeframe an odor was detected by the complainant. Thus it is hard to determine the actual wind direction/speed when the odor was detected. Another issue with analyzing complaints is that significant amounts of information are missing from each complaint. To get a full understanding of CBLF's contribution to the odor, each complaint would ideally include exact time and location the odor was detected, and a description of the odor at that time frame for comparison.

45	3/8/2024	1:00 PM	Ken Kupperman	12425 Sauerkraut Rd	"5"	~ 5 miles	SE	NNE	North-northeast (1 mph). Wind was from the north-northeast (0-2 mph) between 1030 and 1300 hours.	Not likely
46	3/12/2024	2:30 PM	forwarded from DEQ	E.E. Wilson State Wildlife Area	"landfill odor with a noxious chemical component"	~ 1 mile	W	SSW	South-southwest wind (9 mph). Strong winds (6-9 mph) between 1330 and 1430 hours are not typically associated with odor complaints.	Not likely
47	3/23/2024	8:00 AM	Kate Schoenhals	White Fir and Trillium Lane, also Robison road	"foul/gassy, for two hours"	~ 1.1 to 1.8 miles	Various	Calm	Northeast wind (0 mph). Winds were from the northeast (0-2 mph) between 0500 and 0800 hours.	Not likely
48	4/1/2024	8:00 AM	Elizabeth Patte	37655 Zeolite Hills Rd	10	~ 3.6 miles	NE	Calm	South-southwest wind (0 mph). Winds were calm (0 mph) between 0000 and 0800 hours except for south-southwest (1 mph) at 0400 hours.	Not likely

Comparison of CBLF Odor Complaints to On-site Wind Data

Odor Event ID	Odor Event Date	Odor Event Time	Complainant	Location of Odor	Description/Rating	Distance from Complaint Location to CBLF *	Direction from Complaint Location to CBLF **	On-site Wind Direction	Comments	Correlation Category
49	4/1/2024	9:00 AM	Vicki Druliner	27673 Writsman Creek Drive	"incredibly bad", 10	~ 3.7 miles	NE	Calm	South-southwest wind (0 mph). Winds were calm (0 mph) between 0000 and 0900 hours except for south-southwest (1 mph) at 0400 hours.	Not likely
50	4/1/2024	11:30 PM	Nathalie Sutherland	2281 Paddington Dr NW	10, "smells like rotten eggs. But worse. More chemically."	~ 5.2 miles	WNW	Calm	Southeast wind (0 mph). Winds were mostly calm (0 mph) between 1830 and 2330 hours except for east-southeast (1 mph) at 2300 hours.	Not likely
51	4/12/2024	7:00 AM	forwarded from DEQ	"my house"	"overpowering landfill stench"	(N/A)	(N/A)	Calm	North-northeast wind (0 mph). Winds were from the north-northeast (0-1 mph) between 0600 and 0700 hours.	Possible
52	5/2/2024	7:00 PM	forwarded from DEQ	(N/A)	"Strong odors"	(N/A)	(N/A)	Calm	East-northeast wind (0 mph). Winds were calm (0 mph) between 1500 and 1900 hours.	Possible
53	5/23/2024	7:30 AM	forwarded from DEQ	(N/A)	"smell of Garbage" overwhelming	(N/A)	(N/A)	NNE	North-northeast wind (4 mph). Winds were calm (0 mph) between 0300 and 0700 hours.	Possible
54	5/23/2024	7:50 AM	forwarded from DEQ	5 miles from the dump	smell the dump	~ 5 miles	(N/A)	NNE	North-northeast wind (3-4 mph). Winds were calm (0 mph) between 0300 and 0700 hours.	Possible
55	5/23/2024	9:30 AM	forwarded from DEQ	5 miles south, adair	"coffin Butte's effluence"	~ 5 miles	N	NNE	North-northeast wind (3 mph). Winds were from the north-northeast (0-4 mph) between 0730 and 0930 hours.	Possible
56	5/23/2024	6:00 PM	forwarded from DEQ	"near coffin Butte"	"trash and rotten egg"	~ 0 miles	Various	NE	Northeast wind (10 mph). Strong winds are not typically associated with odor complaints.	Not likely
57	7/12/2024	12:06 AM	forwarded from DEQ	"south of the landfill"	"landfill smell"	~ 0 miles	N	WSW	West-southwest wind (3 mph). Winds were from the northwest (1-2 mph) between 2300 and 2330.	Not likely
58	7/24/2024	1:00 PM	forwarded from DEQ	near SE corner of Landfill buffer property	Noticeable unpleasant methane odor	~ 0 miles	NW	S	South wind (6 mph). Winds were from the northwest (4 mph) at 1230 hours.	Possible
59	7/30/2024	5:30 PM	forwarded from DEQ	4 miles SE of landfill	"landfill dump smell"	~ 4 miles	NW	SW	Southwest wind (6 mph).	Not likely
60	8/4/2024	8:30 AM	forwarded from DEQ (8/26)	SW of Landfill or driving by	dump stench	~ 0 miles	NE	Calm	South wind (0 mph). Wind was calm (0 mph) between 0600 and 0830 hours.	Possible
61	8/8/2024	7:40 AM	Ryan Griffin	Oak Grove Drive & Powers	"dump smell, like driving by", "10"	~ 4 miles	WNW	Calm	West-southwest wind (0 mph). Winds were from the west-southwest (0-3 mph) between 0330 and 0800 hours.	Not likely
62	8/8/2024	7:45 AM	Lauren Griffin	Palestine & Oak Grove	"9"	~ 3.8 miles	WNW	Calm	West-southwest wind (0 mph). Winds were from the west-southwest (0-3 mph) between 0330 and 0800 hours.	Not likely
63	8/9/2024	3:15 PM	forwarded from DEQ	(N/A)	Piercing garbage smell	(N/A)	(N/A)	WNW / NE	West-northwest wind (2 mph) at 1500 hours. Northeast wind (2 mph) at 1530 hours.	Possible
64	8/9/2024	5:53 PM	forwarded from DEQ	"miles away"	"terrible smell"	~ 2+ miles	(N/A)	SW	Southwest wind (10 mph). Strong winds are not typically associated with odor complaints.	Not likely
65	8/18/2024	7:30 AM	Ryan Griffin	Oak Grove Drive & Powers	"smells like driving by the dump", 8	~ 4 miles	WNW	Calm	South wind (0 mph). Winds were calm (0 mph) between 0500 and 0730 hours except from the south (2 mph) at 0630 hours.	Not likely
66	8/23/2024	6:30 PM	forwarded from DEQ	South of Landfill	"landfill chemical stink"	~ 0 miles	N	NW	Northwest wind (1 mph).	Possible
67	11/26/2024	11:30 AM	forwarded from DEQ	(N/A)	"Coffin Butte dump stench"	(N/A)	(N/A)	SE	Southeast wind (2 mph).	Possible

Comparison of CBLF Odor Complaints to On-site Wind Data

Odor Event ID	Odor Event Date	Odor Event Time	Complainant	Location of Odor	Description/Rating	Distance from Complaint Location to CBLF *	Direction from Complaint Location to CBLF **	On-site Wind Direction	Comments	Correlation Category
68	11/27/2024	7:15 AM	forwarded from DEQ	(N/A)	"went outside with my cup of coffee. Hit with the smell of the landfill"	(N/A)	(N/A)	S / Calm	South wind (0-1 mph). Winds were calm (0 mph) between 0400 and 0630 hours.	Possible
69	11/30/2024	10:00 AM	forwarded from DEQ	7 miles S of landfill	"sitting at my dest, when I stared to smell it. It lasted for a about 3 hours"	~ 7 miles	N	NNE	North-northeast wind (1 mph). Winds were from the north to northeast between 0000 and 1000 hours.	Possible
70	11/30/2024	12:00 PM	forwarded from DEQ	"passing by the… landfill"	"a terrible odor that we could smell from our car for about a mile north	~ 0 miles	Various	ENE	East-northeast wind (1 mph).	Possible
71	12/1/2024	8:30 AM	forwarded from DEQ	Soap Creek/Writsman Brook	"some sort of chemical", "rotten garbage"	~ 3.7 miles	NE	Calm	South-southwest wind (0 mph). Wind was calm (0 mph) between 0200 and 0830 hours.	Not likely
72	12/1/2024	10:00 AM	forwarded from DEQ	"near Coffin Butte"	"odor is so bad"	~ 0 miles	Various	SSW	South-southwest wind (1 mph). Wind was calm (0 mph) between 0200 and 0930 hours.	Possible
73	12/1/2024	10:00 AM	forwarded from DEQ	(N/A)	"sometimes unbearable"	(N/A)	(N/A)	SSW	South-southwest wind (1 mph). Wind was calm (0 mph) between 0200 and 0930 hours.	Possible
74	12/1/2024	11:52 AM	forwarded from DEQ	"soap creek valley"	"toxic landfill gases"	~ 3.3 miles	NE	N	North wind (3 mph). Winds were from the south-southwest (0-2 mph) between 1000 and 1130 hours. Possible due to channeling effects of terrain.	Possible
75	12/6/2024	9:45 AM	forwarded from DEQ	(N/A)	"landfill stench"	(N/A)	(N/A)	Calm	North-northeast wind (0 mph). Winds were mainly from the north-northeast (0-4 mph) between 0530 and 1000 hours.	Possible
76	12/14/2024	1:30 PM	forwarded from DEQ	Coffin Butte Road	“like a cross between a putrid low tide and an auto repair garage”.	~ 0 miles	Various	SSW	South-southwest wind (3 mph). Winds were from the south-southwest (0-3 mph) between 1030 and 1330 hours.	Not likely
77	12/20/2024	3:00 PM	forwarded from DEQ	4 miles SSE of the Landfill	"odor" "far worse than usual"	~ 4 miles	NNW	Calm	West wind (0 mph). Winds were from the west (0-4 mph) between 1330 and 1500 hours.	Not likely
78	12/23/2024	09:30 AM-12:30 PM	forwarded from DEQ	(N/A)	“Coffin Butte Landfill is belching landfill gas permeating the air. I was 6.3 miles from the landfill and the stench was very noticeable.”	~ 6.3 miles	(N/A)	Calm / NE	Northeast wind (0-4 mph) during this time period. Winds were calm (0 mph) between 0330 and 1030 hours.	Possible
79	12/23/2024	2:00 PM	Maggie Livesay	7580 NW Mountain View Drive	landfill smell, 5	~ 4.2 miles	N	Calm	Northeast wind (0 mph). Winds were from the northeast (4 mph) at 1200 hours. Winds were calm (0 mph) between 1230 and 1400 hours.	Not likely
80	12/29/2024	9:29 AM	Virginia Scott	"driving past dump"	"stench", "not one type of aroma"	~ 0 miles	Various	SSE	South-southeast wind (2 mph). Winds were calm (0 mph) between 0700 and 0900 hours.	Not likely
81	12/29/2024	9:29 AM & 6:30 PM	forwarded from DEQ	(N/A)	“As I was driving past the Coffin Butte dump on Coffin Butte Road in Benton County, OR on Sunday morning the stench was so strong that I has to put the car's air on recirculate until I was well north of the dump. It was equally as terrible on my return trip past the dump at about 6:30 PM on 12/29/24 and was smelly even on recirculate well past the Tampico/Soap Creek intersection. This is an issue because on moist days, like Sunday, when the car air is on recirculate, the car windows fog up which makes it dangerous to turn onto Hwy 99.”	Various	Various	SSE / S	South-southeast wind (2 mph) at 0930 hours. South wind (2 mph) at 1830 hours.	Likely

Comparison of CBLF Odor Complaints to On-site Wind Data

Odor Event ID	Odor Event Date	Odor Event Time	Complainant	Location of Odor	Description/Rating	Distance from Complaint Location to CBLF *	Direction from Complaint Location to CBLF **	On-site Wind Direction	Comments	Correlation Category
82	12/29/2024	4:45 PM	forwarded from DEQ	(N/A)	"Almost every evening to early morning there is a strong methane odor originating from the Coffin Butte Landfill located north of Corvallis in Benton County Oregon. This year the odor has become strong enough to smell indoors if an air filter isn't in use. There is also a tremendous amount of litter and garbage along Camp Adair Road, Hwy 99 and other tributary roads leading to the landfill. The garbage is on the roads, in the ditches soaking in water and leaching into the ground. The air and material pollution is a hazard to humans, wildlife and plant life in the local area. There is no telling what chemicals and hazardous materials are contaminating the local biosphere."	(N/A)	(N/A)	S	South wind (2 mph).	Possible
83	12/31/2024	3:45 PM	forwarded from DEQ	(N/A)	"Coffin butte landfill is releasing methane gas and stink into the atmosphere. The stink is becoming worse each day. I don't have enough time to notify you each day of the occurrence but it is becoming much more frequent, approximately 5 days a week now."	(N/A)	(N/A)	S	South wind (2-3 mph).	Possible
84	1/1/2025	12:00 AM	forwarded from DEQ	(N/A)	"The Coffin Butte Landfill stench was wafting through the air. Landfill gasses 5 miles from the Landfill. Very strong odor"	~ 5 miles	(N/A)	SW	Southwest wind (1 mph).	Possible

Notes:

* Fugitive emissions assumed 75% gas collection and 25% fugitive loss.

** Flare emissions assumed 98% destruction of the 75% gas collection, then a 50% / 50% split for Open Flare 1 and Open Flare 2.

File No. 04225008.00

MEMORANDUM

TO: Jeffrey G. Condit– Miller Nash LLP

FROM: Jeff Leadford, P.E. – SCS Engineers

SUBJECT: Beyond Toxics Testimony Response at the Coffin Butte Landfill

The Coffin Butte Landfill (Coffin Butte, or Landfill) is currently in the application process of a proposed expansion. On May 6, 2025 Mason Leavitt with Beyond Toxics submitted testimony and documents in opposition to the proposed expansion effort. This memo serves as the SCS Engineers (SCS) response to his testimony regarding certain odor issues raised, including Mr. Leavitt's critiques of SCS's "Coffin Butte Landfill 2024 Expansion Application Odor Dispersion Modeling Study (Modeling Study).

In Paragraph 6 of his testimony, Mr. Leavitt claims that the Landfill asserts 99% of odor complaints were deemed "impossible" to be from the landfill. Ostensibly, Mr. Leavitt is referring to Section 2.7 (Odor Complaint History) and Section 5.2 (Odor Complaint Conclusions) of SCS's Modeling Study. Mr. Leavitt's testimony misstates the conclusions of the complaint data analysis that SCS completed. The Modeling Study did not determine that 99% of odor complaints were impossible to come from the landfill; the study only noted that 1% could be considered "likely", and 29% "not likely" to have the Landfill as their source. Most of the complaints lacked data to make a complete determination. Contrary to Mr. Leavitt's testimony, SCS properly contextualized and accounted for the complaints in the Modeling Study.

Paragraph 7 in Mr. Leavitt's testimony mentions that the weather (meteorological) data used in the Modeling Study was an "educated guess on how air has moved around the nearby area of the landfill". In fact, however, the meteorological data used in modeling was obtained from an Oregon Department of Environmental Quality (DEQ) certified dataset using an on-site meteorological tower that was in operation in 2004 through 2005. For site-specific modeling, a certified dataset of on-site meteorological data, which is accepted for use in regulatory modeling, is really the "gold standard". This is discussed in Section 3.6 of the Modeling Study.

Paragraph 10 in the testimony discusses the 75% control efficiency used in the Modeling Study (and thus the other 25% being emitted fugitively from the landfill surface). This standardized control efficiency is mentioned in the Oregon Landfill Methane Rule Commission Meeting Document from September 30 and October 1, 2021 (Table 3, citation 1) and was used as a standard benchmark.

Also in Paragraph 10, Mr. Leavitt mentions holes in the covers and tarps over landfill waste as a potential source of additional landfill gas emissions. The covers and tarps (which incidentally are not

required to be used by any applicable regulations) are not in place to keep landfill gas in, rather they are used to help reduce the amount of precipitation entering the Landfill. Cover soils are deposited over waste to control landfill gas migration, as well as the negative pressure applied in the waste by landfill gas collection wells. From the EPA's National Emission Standards for Hazardous Air Pollutants (NESHAP) Subpart AAAA regulations, quarterly surface emission monitoring and compliance ensures that the standard of 75% control efficiency is being maintained.

In Paragraph 15 of the testimony, Mr. Leavitt alleges that hydrogen sulfide (H2S) concentrations of 250 to 500 parts per billion (ppb) were detected at residences near the Landfill. There are several issues with the presentation of these concentrations. First, SCS performs hydrogen sulfide (H2S) monitoring frequently on landfills throughout the nation and has never seen levels of 250 to 500 ppb at the property boundary or further away from a landfill. Typical levels at the property boundary can be in the 0 to 10 ppb range, and in serious cases up to 30 ppb. Below are links to publicly available monitoring at two landfills that have had public feedback and/or regulator requirements to perform routine monitoring:

https://bristolvalandfill.org/air-sampling-and-air-monitoring

https://chiquitacanyon.com/reports/community-air-monitoring-program/

SCS is able to provide additional documented studies to back up these typical concentrations upon request.

Second, AERMOD, the modeling software used in the Modeling Study, uses a Gaussian Plume Model to describe concentrations in air from a source. This model describes how concentrations are diluted over time with distance away from a source, and thus show that further out residences can expect much lower concentrations of the pollutant. Also from our site-specific modeling we have confirmed that concentrations do decrease with distance from the Landfill.

Third, the reported H2S monitoring data did not provide training certification for the operators of the Jerome gas analyzer (the device used to detect H2S concentrations). In addition, calibration documentation for the meter were not supplied. These pieces of information would be needed to back up such a significant claim of concentration. The Jerome gas analyzer must maintain a strict maintenance schedule, a sample of which is given in Table 1 below.

Table 1: Jerome Typical Calibration Schedule

PART/COMPONENT	MAINTENANCE CYCLE
Charge battery	Depends on usage. See **Battery Management** section for guidelines.
Change .25 inch fritware	Weekly or as needed
Change internal filters and tubing	After 6 months of use or as needed
Replace Zero Air Filter	Annually
Factory calibration	Annually
Functional check	Monthly or as needed
Replace battery	Annually or as needed. The battery pack contains NiMH batteries. Please dispose of properly.

Finally, the air dispersion model, revised as the County's consultant (Maul Foster and Alongi) requested, indicates that even at final buildout, the maximum impact of H2S would be 9.52 micrograms per meter cubed, or 6.24 ppb, at the fence line. Please see the Modeling Study revised in June 2025. In addition, other sources of H2S in the region were not accounted for in the Beyond Toxics study.

If you have any questions, please contact Jeff Leadford at jleadford@scsengineers.com or 720-272-0172.

Sincerely,

Jeff Leadford, PE

Justin Morgan, INCE

RE: *Republic Services Coffin Butte Landfill – Additional Noise Mitigation*

This memorandum summarizes updated predicted sound levels from additional noise mitigation measures for the Republic Services Coffin Butte Landfill. These measures were developed to reduce predicted sound levels at nearby noise sensitive properties from proposed operations within the expansion area. We recommend the following condition of approval to address noise concerns raised in the staff report dated April 22, 2025. This condition is expected to limit increases to existing ambient conditions to not more than 6 dB at the nearest noise-sensitive receptor during the quietest operating hour.

> *Prior to the start of commercial operations in the expansion area, the Applicant shall verify by field measurement that sound levels of on-site equipment have been reduced by at least 10 dB compared to levels in Table 5.3 of the Noise Study dated September 25, 2023. Mitigation measures could include but would not be limited to upgraded engine mufflers, quieter equipment, and local noise barriers around stationary equipment. This condition shall not apply to commercial or residential haul vehicles. To verify equipment sound levels remain 10 dB below the levels shown in the Noise Study, sound levels from equipment will be measured at least once each week using a sound level meter or application installed on a mobile device. Additional measurements will be made every three years using a Type 1 sound level meter and will be overseen by a licensed engineer in the State of Oregon. These triennial measurements will be used to prepare updated noise studies.*

Noise Mitigation Implementation

The intent of including multiple mitigation options is that on-site equipment used in the expansion will be different than what was used in the study due to regular maintenance and replacement intervals. Most of the on-site equipment measured in the noise study was near the end of its maintenance cycle, providing a “worst case” emission level. Therefore, the most appropriate noise control measure for a particular piece of equipment will depend on the equipment fleet in use near the time operations in the expansion area begin. For example, a new dozer will likely be fitted with a muffler that has a higher performance level than what was in use during the Noise Study and may not require additional upgrades to achieve a 10 dB reduction.

Replacing stock engine exhaust mufflers with upgraded mufflers has been demonstrated to achieve 10 dB of noise reduction and are commonly installed on diesel engines. Aftermarket mufflers are available from several manufacturers and if necessary custom mufflers would be available from equipment manufactures or third-party vendors. In addition to mufflers, many equipment manufactures offer accessories that can help reduce sound levels from equipment, such as engine shrouds and baffles. The appropriate make and model of muffler would

206-378-0569
greenbusch.com
Seattle | Vancouver | Spokane

need to be identified prior to operations in the expansion area, since any muffler selections made for current equipment would likely not apply when the operations begin approximately 10 years in the future.

Downsizing mobile equipment, such as dozers, would also reduce sound levels. For example, product data from CAT shows that downsizing from a CAT D9 dozer to a D8 is 2 dB quieter and a D6 dozer is 4 dB quieter. Evolution of other technologies with lower noise emissions such as propane, diesel-hybrid, and fully electric will also influence future equipment procurement options.

Constructing noise barriers around stationary equipment or operations, such as the tippers, would provide further noise reduction. The noise reduction from noise barriers is typically 5 dB near the barrier. Barriers would be constructed to achieve a minimum surface weight of 4 pounds per foot^2. Noise barriers at the site perimeter were investigated but found to be relatively ineffective and come with a host of other site complications (visual impacts, side grading, etc.).

To verify noise emissions from on-site equipment remains 10 dB below the sound levels shown in Table 5.3 of the Noise Study issued on September 25, 2023, and to quickly identify potential issues, sound levels from on-site equipment will be measured at least once a week using a sound level meter or application installed on a mobile device. In addition to these weekly measurements, sound levels will also be measured every three years and used to prepare the updated noise studies. These triennial measurements would be made with a Type 1 sound level meter and overseen by a licensed engineer in the State of Oregon.

Verification measurements may need to be made outside of normal operating hours to reduce noise contributions from other sources. Mitigation measures found to not provide at least 10 dB of noise reduction would be replaced or additional measures would be implemented and measurements would be repeated.

Noise Mitigation Performance

Predicted sound levels with and without additional mitigation measures are compared to the median existing sound levels measured during the landfill's operating hours in Table 1. A comparison against the quietest hour measured during the landfill's operating hours is shown in Table 2. As shown in Table 1, predicted sound levels from the site are anticipated to remain below median existing sound levels without the inclusion of additional noise mitigation. Table 2 shows increases to the quietest existing sound level are predicted to be limited to 6 dB at Location 4 with the inclusion of additional noise mitigation, all other locations would be below the quietest existing sound level.

It should also be noted that while Oregon Administrative Rules (OAR) also limit increases to the existing L_{10}, these existing conditions are higher than the L_{50} metric by a greater margin than L_{10} site emissions will be above L_{50} site emissions, therefore L_{50} is the constraining metric that is most critical to addressing noise effects from the site.

Table 1. Mitigated Sound Levels Compared to Existing Conditions, dBA

Measurement Location	Median Ambient Sound Level (L_{50})		Predicted Sound Levels (L_{50})		Increase to Existing Sound Levels	
	Daytime	Nighttime	No Mitigation	Additional Mitigation	No Mitigation	Additional Mitigation
Location 1	34	34	27	23	**0**	**0**
Location 2	38	37	35	33	**0**	**0**
Location 3	54	51	39	38	**0**	**0**
Location 4	41	40	39	34	**0**	**0**

206-378-0569
greenbusch.com

Table 2. Mitigated Sound Levels Compared to Existing Quietest Hour, dBA

Measurement Location	Quietest Ambient Sound Level (L_{50})		Predicted Sound Levels (L_{50})		Increase to Existing Sound Levels	
	Daytime	Nighttime	No Mitigation	Additional Mitigation	No Mitigation	Additional Mitigation
Location 1	27	30	27	23	**0**	**0**
Location 2	33	34	35	33	**2**	**0**
Location 3	47	47	39	38	**0**	**0**
Location 4	28	34	39	34	**11**	**6**

To further reduce the potential noise effects at nearby properties audio files recorded during the measurements of on-site equipment and at the ambient measurement locations were reviewed to identify short term events that may not have been captured by the hourly L_{50} noise metric. The only transient events identified during this review were tonal backup alarms used by on-site equipment. Although noise from backup alarms is exempt from OAR sound limits; to address the potential effects within the community, backup alarms will be replaced with ambient sensing broadband backup alarms. Ambient sensing broadband backup alarms are typically quieter than standard alarms, adjust their volume based on the surrounding noise environment, and replace tonal alarm noises with broadband noise. During times when the surround sound levels are low, the alarms are quiet and if sound levels in the area increase the alarm also increases to maintain audibility and comply with safety standards. For example, the Street SMART bbs-tek alarm automatically adjusts to be 5-10 dB above the ambient noise level, ensuring reliable audibility while limiting overall sound level.

Sincerely,

Adam C. Jenkins, PE, INCE Bd. Cert., CTS-D

State of Oregon Department of Environmental Quality

Cleaner Air Oregon Facility Prioritization Results

March 1, 2019

About Cleaner Air Oregon

The Cleaner Air Oregon program and rules add public health-based protection from emissions of toxic air contaminants to the state's existing air permitting regulatory framework. The goal of the Cleaner Air Oregon program is to evaluate potential health risks to people near commercial and industrial facilities that emit regulated toxic air contaminants, communicate those results to affected communities, and reduce those risks to below health-based standards.

Purpose of this report

This report documents the results of DEQ's prioritization process for identifying existing permitted facilities for beginning further analysis as part of the Cleaner Air Oregon risk assessment process. The process followed DEQ's 2018 draft prioritization memo, which proposed a method that considers numerical prioritization values, as well as certain qualitative factors. Based on these factors, facilities are placed in priority groups or tiers. As facilities are called in, they will perform air toxics risk assessments that will determine the actual risk associated with facility emissions.

Limitations of the evaluation

The described prioritization process was established as a method to initiate the call in process for existing permitted sources. Consistent with OAR 340-245-0050, DEQ may at its discretion call in any facility at any time, regardless of the groups established in this memo. Sources applying for a modification to their facility that triggers major New Source Review/Prevention of Significant Deterioration or a Type A State New Source Review will also be required to perform a CAO risk assessment. Other types of permit modifications do not trigger mandatory call in.

This prioritization process is not a risk assessment, and the results should not be interpreted as a health assessment or statement of potential health risks from any of the facilities evaluated. This process was undertaken to determine a priority for facilities in each DEQ region for entry into the program. Health risks associated with emissions of toxic air contaminants from prioritized facilities can only be determined after that facility has completed an approved health risk assessment after being called into the CAO program.

Prioritization is based upon information DEQ had at the time of this evaluation. Any new information not previously considered may affect call in priorities in the future.

Facilities with Title V, Standard ACDP, Simple ACDP, and some General ACDP permits were evaluated for prioritization.

Summary of Results

Consistent with the 2018 memo, DEQ calculated a prioritization score for each facility. DEQ then considered additional qualitative criteria, such as sufficiency of the emissions data,

distance to the nearest exposure location, and whether or not emissions are controlled, among other criteria. Using the results of these evaluations, DEQ has established the following groups for call in to the CAO program.

Names of facilities included in Groups 1 and 2 are shown below. Names and data for all facilities included in the prioritization can be found on the Cleaner Air Oregon website and in the prioritization details spreadsheet.

Group 1 (20 facilities): These facilities will likely be called in during the first 12 months. Six members of Group 1, two from each DEQ region, are being called in to Cleaner Air Oregon now. From DEQ Northwest Region, Columbia Steel Casting and Owens-Brockway Glass Container. From DEQ Western Region, Entek International and Roseburg Forest Products' Medford facility. From DEQ Eastern Region, AmeriTies West and Chemical Waste Management of the Northwest.

- AmeriTies West, LLC (The Dalles)
- Boise Packaging & Newsprint, L.L.C. (Salem)
- Cascade Steel Rolling Mills, Inc. (McMinnville)
- Chemical Waste Management of the Northwest, Inc. (Arlington)
- Collins Pine Company (Lakeview)
- Columbia Steel Casting Co Inc. (Portland)
- Covanta Marion, Inc. (Brooks)
- Eagle Foundry Co. (Eagle Creek)
- Ecolube Recovery LLC (Portland)
- Entek International LLC (Lebanon)
- Georgia-Pacific Toledo LLC (Toledo)
- Hollingsworth & Vose Fiber Company (Corvallis)
- Oil Re-Refining Company (Klamath Falls)
- Owens-Brockway Glass Container Inc. (Portland)
- PCC Structurals, Inc. (Portland)
- PCC Structurals, Inc. (Clackamas)
- Roseburg Forest Products Co (Medford)
- Hydro Extrusion Portland, Inc. (Portland)
- Stimson Lumber Company (Gaston)
- Wolf Steel Foundry, Inc. (Hubbard)

Group 2 (20 facilities): These facilities may be called in during the next 2-3 years.

- Biomass One, L.P. (White City)
- Boeing Company (Gresham)
- Boise Cascade Wood Products, L.L.C. (Medford)
- Cornerstone Industrial Minerals Corporation U.S.A. (Lakeview)
- East Side Plating, Inc. (Portland)
- Elkay Wood Products Company (Independence)
- Freres Lumber Co. Inc. (Lyons)
- Hampton Lumber Mills, Inc. dba Tillamook Lumber Company (Tillamook)
- Intel Corporation (Hillsboro)
- Interfor U.S. Inc. (Gilchrist)
- Microchip Technology, Inc. (Gresham)
- Murphy Company dba Murphy Plywood (Rogue River)

- Mutual Materials Company (Gresham)
- Oil Re-Refining Company Inc. (Portland)
- Orchid Orthopedic Solutions Oregon, Inc (Oregon City)
- Pacific Wood Laminates, Inc. (Brookings)
- Roseburg Forest Products Co (Dillard)
- Swanson Group Mfg. LLC (Roseburg)
- TDY Industries, LLC dba ATI Wah Chang (Albany)
- VADATA, Inc. (Boardman)

Group 3 (315 facilities): These facilities have a lower priority for call into the CAO process. Actual call in date will depend on regional and program priorities and available resources, and/or other new information about a source in this group.

Group 4 (8 facilities): These facilities are closed, closing, or have no air toxics emissions. These facilities will not be called in to CAO unless new information is received.

For a full list, including Group 3 and Group 4 facilities, please see the prioritization details spreadsheet.

Facilities with Basic and General ACDP permits that were not included in the prioritization scoring will be treated like those in Group 3. DEQ will evaluate each of these permits over time to assess whether additional conditions are needed to assess or meet health risk benchmarks.

How the Prioritization Process was completed

In June 2018, during the CAO rulemaking, DEQ in consultation with the Oregon Health Authority published a Draft Cleaner Air Oregon Initial Facility Call-in Prioritization Protocol detailing the agencies' plan for deciding how existing facilities would be prioritized for call in.

Consistent with the above protocol, DEQ performed the prioritization using a two-step process. A total of 363 facilities were included in the prioritization, including all facilities that have Title V, Standard ACDP, or Simple ACDP permits. General ACDP permit holders were also included if emissions data were available in the emissions database.

1. **Prioritization Score**

   The first step was to calculate a prioritization score for each facility. DEQ used emissions inventory data for the reported actual emissions from each facility, together with the Risk-based Concentrations and Lookup Table from the CAO rules, to perform a Level 1 risk screening. The Level 1 risk screening estimates for cancer, chronic noncancer, and acute noncancer risk for each facility were combined to calculate a screening value as follows:

   Equation 1:

$$\boldsymbol{Risk\ Screening\ Value} = (\boldsymbol{Cancer\ screening\ value})/\mathbf{25} + (\boldsymbol{Chronic\ non - cancer\ screening\ value}) + (\boldsymbol{Acute\ non - cancer\ screening\ value})$$

A note about Level 1 risk screening and screening values

Level 1 risk screens do not represent actual risk. These screens use very conservative assumptions (5 meter stack height, 50 meter distance from a residence, and others) to estimate a *worst-case scenario* of possible risk. In most cases, actual risk will be tens or hundreds of times lower than what is estimated by a Level 1 screening. Why does DEQ use a Level 1 screening? These screenings are relatively simple to perform, and can be useful in calculating relative risks between many facilities (such as this prioritization process). Also, if a facility screens below benchmarks in a Level 1 assessment, it can be reasonably assumed that the site does not pose a significant risk.

In addition to the risk screening value for each facility, DEQ considered demographic data for the area around each facility. DEQ used Geographic Information System software and census data to calculate the percent of low-income residents, the percent of minority residents, the percent of residents under 5 years old, and the total number of residents within a one-kilometer radius of the source.

DEQ converted the demographic statistics for each facility to a percentile, relative to the demographic statistics for the other facilities in the prioritization. The risk screening value was converted into a percentile in the same way.

DEQ then used Equation 2 to calculate a prioritization score for each facility. The formula puts ¾ of the weight on the risk score, and ¼ of the weight on demographic factors.

Equation 2:

$$Prioritization\ Score = RSVP^{0.75} * \left(\frac{low\ income + minority + residents < 5 + population}{4}\right)^{0.25}$$

Where:

- RSVP means the percentile ranking of the risk screening value calculated in Equation 1
- Low income means the percentile ranking of the percent of low-income residents within a 1 km radius
- Minority means the percentile ranking of the percent of minority residents within a 1 km radius
- Residents < 5 means the percentile ranking of the percent of residents under 5 years old within a 1 km radius
- Population means the percentile ranking of the total number of residents within a 1 km radius

2. Qualitative Factors

Once a prioritization score had been calculated for each facility, DEQ also considered qualitative information about each facility, and moved some facilities up or down in the prioritization as a result. DEQ considered these qualitative factors:

- The sufficiency of current information about emissions from this facility
- Whether or not the source has existing control devices to reduce its toxic air contaminant emissions
- The approximate distance from the facility to the nearest residential and non-residential receptors
- The efficient allocation of DEQ resources, including distribution of work between DEQ regions.

I. Introduction

Coffin Butte Landfill (CBL) is located at 28972 Coffin Butte Rd, Corvallis, OR 97330 (see Figure 1, Appendix 1). CBL is owned and operated by Valley Landfills, Inc. (VLI). Guzi-West Inspection and Consulting, LLC (Guzi-West) was retained in May 2024 to provide environmental consulting services for the subject facility following issuance of two citations from the Oregon Occupational Safety & Health Division (OR-OSHA). OR-OSHA specifically issued two citations based upon inspections of the facility completed between October 24, 2023, and March 15, 2024. Citation 1, Item 1 was issued due to CBL not identifying and evaluating respiratory hazards in the workplace; meanwhile, Citation 2, Item 2 was issued for a person conducting the bloodborne pathogen program not being knowledgeable in certain subject matter covered by elements in the training. CBL appealed the citations with OR-OSHA office based upon their belief that workers were not being exposed to hazardous air pollutants as demonstrated by area air monitoring performed at the site. Guzi-West was engaged by CBL in early May 2024 following OR-OSHA requesting CBL develop and implement a formal employee exposure assessment program. Guzi-West was instructed to begin work immediately and our office subsequently developed a multi-phase approach to both address the OR-OSHA citations, as well as to review and audit site environmental compliance programs specific to air quality. A description of each phase is presented below:

- Phase 1: Review existing site permitting, operation plans, monitoring programs, regulatory reports, as well as to consult with OR-OSHA on the specific site observations, requests, etc. identified in their citations. Guzi-West produced an Employee Exposure Assessment Plan, dated May 31, 2024, which described site operations, wastes accepted at the site, waste management practices, engineering controls, and a plan for obtaining employee participation in development of the Employee Exposure Assessment Plan. Please refer to Appendix 2 for a complete copy of the Employee Exposure Assessment Plan.
- Phase 2: Guzi-West divided employees into similar exposure groups (SEGs) based upon groups of workers having the same general exposure profile because of the similarities and frequency of the tasks they perform, the materials and processes in which they work, and the similarity of the way they perform the tasks. Guzi-West personnel traveled to the facility on June 20, 2024, to interview at least two (2) workers from each of the following SEGs: Administration/Office Positions, Heavy Equipment Techs/Mechanics, Heavy Equipment Operators, and Spotters & Laborers. To interview employees at random, employees in each category were listed in alphabetical order by last name and the first two employees from each category were selected for interview. Each employee was asked the questions specified on the Employee Exposure Assessment Questionnaire developed in Phase 1.The employees were informed that there were no right or wrong answers, they may not and were not expected to remember certain items, and should they wish to report any concerns anonymously, all employees were given Guzi-West's contact information to do so. The results of the employee interviews along with facility information obtained during Phase 1 were utilized to create a list of potential airborne contaminants to monitor at the site, as well as to identify the work activities which could lead to the highest potential exposures of the airborne contaminants. The goal of monitoring the highest potential exposures is to effectively capture the highest exposure of each given contaminant and assess if workers in the highest likely exposure groups are being exposed above applicable

regulatory limits. A combination of personal monitoring assessments, including short term/excursion monitoring and/or 8-hour time weighted averages, were selected to ensure the periods of highest exposure were captured. A technical letter report was prepared and submitted to CBL personnel on July 1, 2024; please refer to Appendix 3 for additional details regarding Phase 2 work.

- Phase 3: Work in this phase consisted of performing on-site monitoring, submitting samples for laboratory analysis and/or performing analyses in real time, and comparing the site-specific data against regulatory limits and guidelines for exposure limits by contaminant. The subject report presented herein represents the findings of all work completed to date. This Final Report of Findings summarizes all results and provides conclusions and recommendations as necessary.

II. Executive Summary

Guzi-West's first priority on behalf of CBL was to engage with OR-OSHA in order to ensure their concerns were understood so that the citations could be addressed completely and as swiftly as possible. As mentioned above, Citation 1, Item 1 was issued due to CBL not identifying and evaluating respiratory hazards in the workplace (i.e. the citation was issued not necessarily due to employees being exposed to respiratory hazards above permissible exposure limits, but because CBL did not have data to demonstrate their belief that existing engineering controls and personal protective equipment (PPE) already in place were sufficient to protect their workers). The previously referenced Employee Exposure Assessment Plan, provided in Appendix 2, was submitted to OR-OSHA and their representatives accepted this submittal as demonstration that CBL was addressing Citation 1, Item 1. Citation 2, Item 2 was issued for the person conducting the bloodborne pathogen program not being knowledgeable in certain subject matter covered by elements in the training. To address this, CBL arranged for their Area Safety Team to provide the bloodborne pathogen training program to ensure site staff were thoroughly trained in bloodborne pathogens. Following the submittal of documentation of these two items, OR-OSHA reduced the fine to $100, and the two parties agreed to formally settle both citations in June 2024.

Section III below presents the methodology, analytical results, and corresponding regulatory limits for each airborne contaminant. The analytical results demonstrate that CBL employees are not being exposed above short term/excursion limits nor 8-hour time weighted average limits for asbestos, respirable crystalline silica, respirable dust, total inhalable dust, diesel particulate (elemental carbon), and the eleven metals under OSHA's METALSSG-2 sampling group. The engineering controls and personal protective equipment currently utilized in relation to these respiratory hazards appear to be adequate to protect employees from the airborne concentrations they might be exposed to on any given day. The landfill gas monitoring performed identified short term carbon monoxide exposure exceedances specific to a CBL work vehicle, and methane exposure exceedances during well shortening activities as well as during the heavy equipment operator's normal work shift. The remaining gases monitored, including carbon dioxide, hydrogen sulfide, and oxygen, remained below all regulatory thresholds, and/or stayed within acceptable ranges. Implementation of additional engineering controls and work practices subsequently reduced and/or eliminated methane and carbon monoxide exceedances. Engineering controls, respiratory protection, and further monitoring recommendations are explained in detail in the following sections.

III. Employee Personal Air Monitoring Results and Methodology

Guzi-West has identified potential airborne contaminants based upon a review of the facility's operations, waste stream, existing engineering controls, management practices, employee responsibilities, etc. Further, Guzi-West has discussed the operation with OSHA personnel who recently inspected the site, as well as CBL personnel with detailed knowledge of the site and its operation. The contaminants tested for are identified below along with sample collection and analytical methods. The results are provided in the included tables within this report. The Sample ID nomenclature was kept consistent with job classification between different sampling media for easy comparison, as shown in the table below. The DIES02 and DIES03 samples are an exception, which were ambient area air samples taken from the mechanic shop.

Table 1 – Sample Nomenclature

Sample ID	Job Classification	Employee/Area[1]
xxx01-xxxxxx	Heavy Equipment Tech/Mechanic	[redacted]
xxx02-xxxxxx	Heavy Equipment Operator	[redacted]
xxx03-xxxxxx	Laborer	[redacted]
xxx04-xxxxxx	Spotter	[redacted]
xxx05-xxxxxx	Lead Heavy Equipment Operator	[redacted]
xxx-EX-01	Heavy Equipment Operator	[redacted]
xxx-EX-02	Heavy Equipment Tech/Mechanic	[redacted]
xxx-EX-03	Lead Heavy Equipment Operator	[redacted]
DIES02-073024	NA	South Mechanic Shop
DIES03-073024	NA	North Mechanic Shop

[1]Employees listed more than once had multiple samples collected

All personal samples were collected from the breathing zone of potentially affected employees at several different job classifications. The contaminant of interest was sampled for the period of an entire working day and/or for short time periods (typically 30 minutes). Samples were intentionally collected during the period of expected highest exposure and compared against time weighted averages (TWAs), excursion limits (ELs), instantaneous/ceiling limits, or other applicable regulatory thresholds and guidelines. Diesel samples were taken solely from employees within the Heavy Equipment Technician/Mechanic classification, and from the ambient mechanic shop air; meanwhile, landfill gas samples were collected with handheld, instant reading instruments. All air samples submitted for laboratory analysis were sent under chain of custody, to SGS Galson of East Syracuse, New York; SGS Galson is an American Industrial Hygiene Association (AIHA) accredited laboratory. The sample collection and analytical methodology for each contaminant is presented immediately below along with a narrative description of the subject analyte, sample results compared to their respective exposure limits/recommended thresholds, and table/s depicting analytical results. The following section, Section IV. Conclusions and Recommendations, provides a discussion of the results and corresponding recommendations.

Asbestos Air Sampling

Asbestos is the name given to a group of naturally occurring minerals that are resistant to heat and corrosion. Asbestos has been used in a variety of building construction materials for insulation and as a fire retardant, as well as being used in a wide range of manufactured goods/building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings. Asbestos is accepted at the landfill in accordance with special notification,

packaging, and labeling requirements and managed in a dedicated area of the landfill with trained personnel (see Operations and Waste Management information provided in Appendix 2). The health effects of breathing asbestos fibers can cause a buildup of scar-like tissue in the lungs called asbestosis and result in loss of lung function that often progresses to disability and death. Asbestos also causes cancer of the lung and other diseases such as mesothelioma of the pleura which is a fatal malignant tumor of the membrane lining the cavity of the lung or stomach. Asbestos samples were collected and analyzed in accordance with the NIOSH 7400 methodology. Asbestos air samples were collected with a personal air sampling pump running at 1.9-2.1 liters per minute (LPM), and a 25mm open faced cassette equipped with a 0.45-1.2-µm cellulose ester membrane filter. As shown in the table below and the laboratory report provided in Appendix 4, no asbestos samples analyzed exceeded the PEL or EL established by OSHA (29 CFR 1910.1001) and adopted by Oregon OSHA (OAR Chapter 437, Division 2, Subdivision Z, Rule 1910.1001).

Table 2 – Asbestos Air Sampling Results

Respirable Crystaline Silica Sampling

Respirable Crystalline Silica is a common byproduct of common building materials, such as rocks, concrete, brick, sheetrock, etc. Crystalline Silica can be released into the air when these materials are disturbed. Alpha Quartz and Cristobalite are two forms of crystalline silica. Respirable Crystalline Silica (RCS) is a term used to describe very small particles of crystalline silica. These particles are typically smaller than ten microns (10µ) in diameter and are often referred to as "fine" or "ultrafine" particles. When inhaled, these particles can cause serious health problems, including lung cancer, silicosis, and other respiratory diseases. Respirable Crystaline Silica (RCS) samples were collected and analyzed in accordance with the NIOSH 7600/7500 methodology, Silica by XRD. Silica samples were collected with a personal air sampling pump running at 1.9-2.1 liters per minute (LPM), and a parallel particle impactor, containing a pre-weighted 37mm cassette equipped with a 5.0 µm, PVC, filter. As shown in the table below and the laboratory report provided in Appendix 4, no Respirable Crystalline Silica samples analyzed exceeded the PEL established by Oregon OSHA (OAR Chapter 437, Division 2, Subdivision Z, Rule 437-002-0382).

Table 3 - Respirable Silica (RCS) Air Sampling Results			
Personal Samples (PEL: 100 µg/m^3)		Field Blanks

RESP03-073024	<5.1		
RESP04-073024	<5.2		
RESP05-073024	<5.6		

Respirable Dust Sampling

The operation of any landfill creates dust regardless of what engineering controls are utilized and therefore conducting personal air monitoring to assess respirable dust and total inhalable dust (further discussed immediately below) were key contaminants to monitor. Respirable dust refers to particles smaller than ten microns (10µ) in diameter. Their size allows them to travel deeply into the lungs, potentially reaching the gas exchange region. Respirable Dust samples were collected and analyzed in accordance with the NIOSH 0600 methodology. The respirable dust samples were collected with a personal air sampling pump running at 1.9-2.1 liters per minute (LPM), using a parallel particle impactor attachment, containing a pre-weighed 5.0 µm, PVC, filter. As shown in the table below and the laboratory report provided in Appendix 4, no Respirable Dust samples analyzed exceeded the PEL established by Oregon OSHA (OAR Chapter 437, Division 2, Subdivision Z, Rule 437-002-0382).

Table 4 - Respirable Particulate (Respirable Dust) Air Sampling Results			
Personal Samples (PEL: 5 mg/m^3)		Field Blanks	
Sample ID	Conc. (mg/m^3)	Sample ID	Total
RESP01-073024	0.53	RESP-FB-01	<0.050 mg
RESP02-073024	<0.045	RESP-FB-02	<0.050 mg
RESP03-073024	0.12		
RESP04-073024	<0.052		
RESP05-073024	<0.056		

Total Inhalable Dust Sampling

As opposed to respirable dust, inhalable dust particles can be much larger, up to 100 microns (100µ) in diameter. These particles do not penetrate as deeply as respirable particles but can cause irritation of the eyes, nose, mouth, and throat. The Ambient total inhalable dust samples were collected and analyzed in accordance with the NIOSH 0500 methodology. Samples were collected with a personal air sampling pump running at 1.9-2.1 liters per minute (LPM), and a 37mm cassette, equipped with a pre-weighed 5.0 µm, PVC, filter. As shown in the table below and the laboratory report provided in Appendix 4, no Total Inhalable Dust samples analyzed exceeded the PEL established by Oregon OSHA (OAR Chapter 437, Division 2, Subdivision Z, Rule 437-002-0382).

Table 5 - Total Inhalable Dust Air Sampling Results			
Personal Samples (PEL: 10mg/m^3)		Field Blanks	
Sample ID	Conc. (mg/m^3)	Sample ID	Total

TOTD02-073024	0.15	TOTD-FB-02	<50 mg
TOTD03-072924	0.24		
TOTD04-073024	0.33		
TOTD05-072924	<0.056		

Diesel Particulate Sampling

Diesel particulates are a component of diesel exhaust that are primarily composed of an elemental carbon core, with sulfates, silicates, and other metallic compounds attached to the surface. Exposure to high concentrations of diesel particulates can cause short-term effects such as headaches, dizziness, and mucous membrane irritation, and long-term effects such as cardiovascular, cardiopulmonary, respiratory disease and lung cancer. Because diesel particulates contain a variety of different compounds, the analytical method used for this monitoring measures elemental carbon, which composes the core of diesel particulates. Diesel Particulate (Elemental Carbon) samples were collected and analyzed in accordance with the NIOSH 5040 methodology. Samples were collected with a personal air sampling pump running at 1.9-2.1 liters per minute (LPM), and a 37mm cassette, equipped with a pre-weighed 0.45µm quartz filter. As shown in the table below and the laboratory report provided in Appendix 4, no Diesel Particulate samples analyzed exceeded the PEL established by MSHA (CFR Title 30, Chapter I, Subchapter K, Part 57) and adopted by OSHA. It should be noted that the MSHA PEL is only intended to apply to employee exposure while working in underground metal/nonmetal mines, and as such is not applicable to the employees of Coffin Butte Landfill. It is used in this case as no PEL for non-mining industry has been established for diesel particulate.

Table 6 - Diesel Emission (Total Carbon) Air Sampling Results			
Personal Samples (PEL: 0.16 mg/m^3)		Field Blanks*

DIES03-073024	<0.0035		

*Sample values adjusted against average field blank concentration per NIOSH method 5040. Carbon can occur naturally in uncontaminated sampling media.

Airborne Lead, and Metals Sampling

A wide variety of metals are used for industrial and commercial applications and can often be found in the waste streams of generators with or without the knowledge of either the generator or receiver. The most well-known hazardous metal is lead, which can acutely damage the brain, nervous system and reproductive system, along with a variety of other health effects. Many other metals and metal compounds can have similar effects if exposure occurs at sufficient levels, so it is important to 'cast a wide net' when conducting monitoring. Eleven metals; Antimony, Cadmium, Lead, Chromium, Cobalt, Copper, Iron, Manganese, Nickle, Vanadium and Zinc, were chosen based off the METALSSG-2 metal sampling group provided by OSHA. These were

selected due to their occurrence in general waste streams, stability together on specific sampling media, and their ability to be digested in the same acid matrix for ease and cost effectiveness of analysis. Airborne Metals samples were collected and analyzed in accordance with the NIOSH Method 7300 methodology via Inductively Coupled Plasma Spectroscopy (ICP). The air samples were collected using a personal air sampling pump running at 1.9-2.1 liters per minute (LPM), and a 37mm cassette, equipped with a pre-weighed 0.8 µm, MCE, filter. As shown in the table provided on the following page and the laboratory report provided in Appendix 4, no Metals samples analyzed exceeded the PEL established by Oregon OSHA (OAR Chapter 437, Division 2, Subdivision Z, Rule 437-002-0382).

Landfill Gas Sampling

Gases from landfills occur as a result of biological degradation of organic wastes and potentially as a result of volatile buried waste. The predominant gases produced by a landfill are methane and carbon dioxide making up 99%, or greater, of gases typically produced. In addition to monitoring for methane (CH_4) and carbon dioxide (CO_2), hydrogen sulfide (H_2S), carbon monoxide (CO), and oxygen (abbreviated O in atom form, and O2 as a molecule) were monitored at the subject facility. Landfill gas exposure sampling was conducted on September 26, 2024, from environmental technicians performing gas extraction well shortening, as well as on a spotter and heavy equipment operator throughout the course of their normal work day. Well raising and/or well shortening were identified as the highest potential exposure activities to landfill gases, as the well has to be uncapped temporarily by the workers; see Appendix 3 for a detailed discussion. Gas measurements were specifically collected utilizing the following instant reading gas meters: two RKI GX-3Rs, an RKI GX-6000 Flame Ionization Detector (FID), and a LANDTEC GEM2000. A brief discussion for each gas is presented below, including the exposure limits specified/recommended by regulatory bodies, a summary table of exposure limits, and identification of exposure limit exceedances, where applicable.

Methane and Carbon Dioxide

Methane and carbon dioxide are both classified as simple asphyxiants meaning that, within enclosed areas, either gas can build up and displace oxygen creating an oxygen deficient atmosphere. The Occupational Safety and Health Administration (OSHA) defines an oxygen deficient atmosphere as an oxygen content below 19.5% by volume. Per the National Institute for Occupational Safety and Health (NIOSH), methane is considered a flammable gas with a lower explosive limit (LEL) of 5% by volume and an upper explosive limit (UEL) of 15% by volume; meanwhile, carbon dioxide is not classified as a flammable gas. OSHA has not established a Permissible Exposure Limit (PEL) for methane; however, OR-OSHA has an established methane PEL of 1,000 parts per million by volume (ppmv) when evaluated as an 8-hour time weighted average, a 30-minute excursion limit of 3,000 ppmv (3x the PEL), and a ceiling/instantaneous limit of 5,000 ppmv (5x the PEL) wherein no employee shall be exposed above that concentration at any time. Federal OSHA and OR-OSHA have established the same PEL for carbon dioxide at 5,000 ppmv (0.5% CO2 in air) averaged over an 8-hour workday, and OR-OSHA has further established 15,000 ppmv as a 30-minute excursion limit (3x the PEL), and a ceiling/instantaneous limit of 25,000 ppmv (5x the PEL) wherein no employee shall be exposed above that concentration at any time. NIOSH has established health-based immediately dangerous to life or health (IDLH) values which are set at 10% of the LEL for specific air contaminants, including methane, because the explosive hazards are deemed a greater risk; the IDLH for methane is 5,000 ppmv (10% of the LEL for methane, which is 50,000 ppmv). Carbon dioxide has an established IDLH of 40,000 ppmv.

Hydrogen Sulfide

Hydrogen sulfide is a colorless, flammable, highly toxic gas with a characteristic rotten egg odor. Although its strong odor is readily identified, olfactory fatigue occurs at high concentrations and at continuous low concentrations; thus, odor is not a reliable indicator of hydrogen sulfide's presence and may not provide adequate warning of hazardous concentrations. Federal OSHA and OR-OSHA have established the same ceiling limit concentration of 20 ppmv, and 8-hour TWA of 50 ppmv provided the exposure does not exceed 10 minutes and no other measurable exposures occur. Hydrogen sulfide has an established IDLH of 100 ppmv, LEL of 4.3%, and UEL of 45.0%.

Carbon Monoxide

Carbon monoxide is a colorless, odorless, flammable gas that can cause sudden illness and death if inhaled; it's considered especially dangerous as individuals are often unconscious before they realize they are being poisoned. Federal OSHA and OR-OSHA have established the same 8-hour TWA of 50 ppmv, OR-OSHA has further established 150 ppmv as a 30-minute excursion limit (3x the PEL), and a ceiling limit of 250 ppmv (5x the PEL) wherein no employee shall be exposed above that concentration at any time. NIOSH has a recommended exposure limit of 35 ppmv, an established IDLH of 1,200 ppmv, LEL of 12.5%, and UEL of 74%.

Oxygen

Oxygen is a colorless, odorless gas that typically only poses a hazard in oxygen deficient atmospheres (oxygen content below 19.5% by volume), or in oxygen enriched atmospheres (oxygen content greater than 23.5% by volume). Oxygen deficient atmospheres pose a threat as oxygen levels below 19.5% fall below levels for what is needed for humans to breathe safely, whereas oxygen enriched atmospheres significantly increases the risk of ignition and fire due to the reactivity of oxygen.

Table 8 - Exposure Limit Summary

	CH_4	CO_2	H_2S	CO	O_2
8-hour Time Weighted Average	1,000 ppmv	5,000 ppmv	50 ppmv*	50 ppmv	<19.5% or >23.5%
30-Minute Excursion Limit	3,000 ppmv	15,000 ppmv	NA	150 ppmv	
Instantaneous/Ceiling Limit	5,000 ppmv	25,000 ppmv	20 ppmv*	250 ppmv	
IDLH	5,000 ppmv	40,000 ppmv	100 ppmv	1,200 ppmv	
LEL	5.0%	NA	4.3%	12.5%	
UEL	15.0%	NA	45.0%	74.0%	

* 20 ppmv ceiling limit with one allowed peak exceedance up to 50ppmv for no longer than 10 minutes once in an 8-hr shift (no other exposures can occur in the same day)

Landfill Gas Sampling Events Summary

Two sampling events were performed to assess CBL employees' personal exposure to landfill gas. The initial sampling event was conducted on September 26, 2024, to document existing engineering controls, work practices, and exposures to landfill gases. Carbon monoxide exceedances were identified in the initial monitoring event but were quickly traced to a faulty vehicle exhaust; once the employees exchanged vehicles no further exceedances were observed. Methane exceedances were observed during shortening of a gas extraction well, as well as during completion of the heavy equipment operator's normal work tasks. Increased air movement and/or ventilation was recommended specific to the methane exposures, in addition to recommending staff wearing gas sensors capable of identifying and sounding an alarm if hazards for methane, oxygen, hydrogen sulfide, or carbon monoxide were present. The second sampling event, conducted on November 14, 2024, demonstrated the increased ventilation was effective in eliminating all methane exceedances for the heavy equipment operator. Instantaneous exceedances of methane were observed during well shortening activities again, but the number of exceedances was reduced by over 60%. Further, the instantaneous methane exceedances observed during well shortening were momentary exposures (seconds in most cases), and the use of the instant reading gas sensors further mitigates any exposure risks. A discussion of each monitoring event is presented below by date and is followed by a summary conclusion for all sampling events. Tables

9 and 10 present the landfill gas monitoring results for all events, and the field measurement data is provided in Appendix 4.

September 26, 2024 – Landfill Gas Field Measurements

A CBL spotter and heavy equipment operator were monitored during the course of a normal workday, and their exposures were calculated and respectively compared against the instantaneous/ceiling limit, 30-minute excursion limit, and permissible exposure limit (as an 8-hour time weighted average). As shown in Table 10 on the following page and the field measurement data provided in Appendix 4, the instantaneous/ceiling limit for carbon monoxide was exceeded for the spotter 9 times, and 18 times for the heavy equipment operator; these exceedances are all believed to be the result of a faulty exhaust on a CBL work vehicle. This issue was identified shortly after the two employees were outfitted with the field monitors and following transfer to another CBL vehicle, no additional carbon monoxide exceedances were observed. Guzi-West notified CBL personnel of the issue, with the recommendation that this vehicle be taken out of service and that it, along with all other CBL vehicles, be inspected to ensure their vehicle exhaust systems are free of holes, functioning properly, etc. During the heavy equipment operator's work shift, the methane instantaneous/ceiling and IDLH limit of 5,000 ppm was exceeded two times with a peak of 5,500 ppmv. Further, after calculation of the 8-hour time weighted average for the same monitoring period, the permissible exposure limit for methane was exceeded for the heavy equipment operator. Meanwhile, the spotter did not exceed any methane limits or thresholds during the course of their work shift. The carbon dioxide and hydrogen sulfide levels for both employees remained below all regulatory thresholds, and oxygen levels also stayed within acceptable ranges for both employees. The CBL and Guzi-West teams met shortly after completion of the September monitoring event to discuss the initial monitoring results and to identify where improvements could be made to reduce exposures. The heavy equipment operator's cab ventilation was recommended to be improved by simply cracking the windows of the cab to increase ventilation; meanwhile, an air mover and ducting was proposed to be deployed at the extraction well to pull air and methane away from the well during modification.

November 14, 2024 – Landfill Gas Field Measurements

Monitoring was conducted on one CBL environmental technician during a well shortening activity. The environmental technicians utilized an air mover and flex ducting in an attempt to capture the methane and other landfill gasses escaping the well during the shortening work. As shown in Table 9, four exceedances of the instantaneous limit were observed over the course of the activity; a reduction of over 60% from the September 26, 2024 monitoring event. The four exceedances also occurred within a narrow time frame, within three minutes. Although the instantaneous limit was exceeded, the 30-minute excursion limit for methane (3,000 ppmv) was not exceeded. The CBL and Guzi-West team met again following the November 14, 2024 sampling event to discuss additional/alternative work practices and engineering controls to further reduce short term exceedances of the methane instantaneous/ceiling limit during extraction well modification activities. It was collectively determined that utilizing an electric leaf blower to force fresh air across the extraction well during modification would likely be more effective than trying to pull air away from the well during modification. Guzi-West anticipates utilizing the leaf blower in combination with employees wearing the four gas sensors will demonstrate that even short-term exceedances of the methane instantaneous/ceiling limit will be eliminated.

Exposure data was again collected for a heavy equipment operator during the course of a normal workday. As shown in Table 10, the exposure data collected during this monitoring indicated no exceedances of the PEL for any landfill gas, and no measurable amount of methane was identified

in their workday. The corrective actions performed by CBL appear to have eliminated the heavy equipment operators' exposure to methane. Guzi-West recommends that continued monitoring be conducted annually, at minimum, to ensure exposures to all landfill potential airborne contaminants remain below all regulatory limits. Appendix 5 can serve as a placeholder for documentation of future monitoring records so that this Exposure Report of Findings remains current.

Table 9 - Well Shortening Personal Gas Monitoring									
	CH_4		H_2S	CO		CO_2		O_2

EL - 30-Minute Excursion Limit
I/C - Instantaneous/Ceiling Limit

IV. Conclusions and Recommendations

Excluding methane and carbon monoxide, the analytical results and field measurement data demonstrate CBL employees are not being exposed above short term/excursion nor 8-hour time weighted average limits for asbestos, respirable crystalline silica, respirable dust, total inhalable dust, diesel particulate (elemental carbon), and the eleven metals under OSHA's METALSSG-2 sampling group. The engineering controls and personal protective equipment currently utilized in relation to these respiratory hazards appear to be adequate to protect employees from the airborne concentrations they might be exposed to on any given day.

Field monitoring performed during the September 26, 2024, event identified carbon monoxide exceedances while employees were utilizing a given CBL work vehicle. Once the same employees switched company vehicles, no further carbon monoxide exceedances were observed. Regardless, this does demonstrate all CBL vehicles and their exhaust systems should be routinely inspected to ensure proper operation. During the heavy equipment operator's work shift, the methane instantaneous/ceiling and IDLH limit of 5,000 ppmv was exceeded two times with a peak of 5,500 ppmv. Further, after calculation of the 8-hour time weighted average for the same monitoring period, the permissible exposure limit for methane was exceeded for the heavy equipment operator. Except for where noted above, the remaining landfill gases monitored remained below all regulatory thresholds, and oxygen stayed within an acceptable range. Following the implementation of corrective actions by CBL, follow up monitoring performed on November 14, 2024 demonstrated that methane exposure to the heavy equipment operator had been eliminated. Further, the number of instantaneous methane exceedances observed for the environmental technicians performing well shortening was reduced by over 60% from eleven to four exceedances. The CBL and Guzi-West team met again following the November 14, 2024 sampling event and it was collectively determined that utilizing an electric leaf blower to force fresh air across the extraction well during modification would likely be more effective than trying to pull air away from the well during modification. Guzi-West anticipates utilizing the leaf blower in combination with employees wearing the four gas sensors will demonstrate that even short-term exceedances of the methane instantaneous/ceiling limit will be eliminated. Guzi-West recommends CBL regularly equip heavy equipment operators, spotters, and environmental technicians with four gas meters; alarms for the meters should be programmed based upon the lowest respective regulatory thresholds to alert workers in real time of any landfill gas hazards. Utilizing the four gas meters and documenting the presence or absence of any alarms being triggered will provide constant monitoring information to demonstrate whether any landfill gas hazards are present and/or if the updated engineering controls and work practices remain effective in eliminating exposure hazards. In the event four gas meter alarms are being triggered by exceedance of an IDLH limit, NIOSH states a self-contained breathing apparatus (SCBA), or combination supplied air/SCBA respirator, should be used. Guzi-West recommends that monitoring be conducted annually, at minimum, to ensure exposures to all landfill potential airborne contaminants remain below all regulatory limits. Appendix 5 can serve as a placeholder for documentation of future monitoring records so that this Exposure Report of Findings remains current.

Dear Clay Guzi:

Enclosed are the analytical results for the samples received by our laboratory on August 05, 2024. All samples on the chain of custody were received in good condition unless otherwise noted. Any additional observations will be noted on the chain of custody.

Please contact client services at (888) 432-5227 if you would like any additional information regarding this report. Thank you for using SGS Galson.

Sincerely,

SGS Galson

Lisa Swab

ANALYTICAL REPORT

Terms and Conditions & General Disclaimers

- This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.
- Any holder of this document is advised that information contained herein reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Analytical Disclaimers

- Unless otherwise noted within the report, all quality control results associated with the samples were within established control limits or did not impact reported results.
- Note: The findings recorded within this report were drawn from analysis of the sample(s) provided to the laboratory by the Client (or a third party acting at the Client's direction). The laboratory does not have control over the sampling process, including but not limited to the use of field equipment and collection media, as well as the sampling duration, collection volume or any other collection parameter used by the Client. The findings herein constitute no warranty of the sample's representativeness of any sampled environment, and strictly relate to the samples as they were presented to the laboratory. For recommended sampling collection parameters, please refer to the Sampling and Analysis Guide at www.sgsgalson.com.
- Unrounded results are carried through the calculations that yield the final result and the final result is rounded to the number of significant figures appropriate to the accuracy of the analytical method. Please note that results appearing in the columns preceding the final result column may have been rounded and therefore, if carried through the calculations, may not yield an identical final result to the one reported.
- The stated LOQs for each analyte represent the demonstrated LOQ concentrations prior to correction for desorption efficiency (if applicable).
- Unless otherwise noted within the report, results have not been blank corrected for any field blank or method blank data.

Accreditations SGS Galson holds a variety of accreditations and recognitions. Our quality management system conforms with the requirements of ISO/IEC 17025. Where applicable, samples may also be analyzed in accordance with the requirements of ELAP, NELAC, or LELAP under one of the state accrediting bodies listed below. Current Scopes of Accreditation can be viewed at http://www.sgsgalson.com in the accreditations section of the "About" page. To determine if the analyte tested falls under our scope of accreditation, please visit our website or call Client Services at (888) 432-5227.

National/International	Accreditation/Recognition	Lab ID#	Program/Sector
AIHA-LAP, LLC - IHLAP, ELLAP, EMLAP	ISO/IEC 17025 and USEPA NLLAP	Lab ID 100324	Industrial Hygiene, Environmental Lead, Environmental Microbiology

State	Accreditation/Recognition	Lab ID#	Program/Sector
New York (NYSDOH)	ELAP and NELAC (TNI)	Lab ID: 11626	Air Analysis, Solid and Hazardous Waste
Louisiana (LDEQ)	LELAP	Lab ID: 04083	Air Analysis, Solid Chemical Materials

Legend

< - Less than	mg - Milligrams	MDL - Method Detection Limit	ppb - Parts per Billion
> - Greater than	ug - Micrograms	NA - Not Applicable	ppm - Parts per Million
l - Liters	m3 - Cubic Meters	NS - Not Specified	ppbv - ppb Volume
LOQ - Limit of Quantitation	kg - Kilograms	ND - Not Detected	ppmv - ppm Volume
ft2 - Square Feet	cm2 - Square Centimeters	in2 - Square Inches	ng - Nanograms

L633639 (Report ID: 1440460):
For applicable NYS sampling events, laboratory accreditation through NYSDOH applies only to Lead results.
Reported results reflect elemental analysis of the requested metals. Certain compounds may not be solubilized during digestion, resulting in data that is biased low.
SOPs: MT-SOP-29(15), MT-SOP-27(22)
One out of eight blank spikes recovered below control limits (90.8 to 121%) at 90.3% for Cobalt.
One out of eight blank spikes recovered below control limits (89.9 to 122%) at 89.4% for Copper.

L633639 (Report ID: 1440460):
Accuracy and mean recovery data presented below is based on a 95% confidence interval (k=2). The estimated accuracy applies to the media, technology, and SOP referenced in this report and does not account for the uncertainty associated with the sampling process. The accuracy is based solely on spike recovery data from internal quality control samples. Where N/A appears below, insufficient data is available to provide statistical accuracy and mean recovery values for the associated analyte.

Parameter	Accuracy	Mean Recovery
Antimony	+/-11.4%	101%
Cadmium	+/-9.7%	105%
Chromium	+/-9.6%	106%
Cobalt	+/-9.5%	106%
Copper	+/-10%	106%
Iron	+/-11.3%	107%
Lead	+/-10.4%	103%
Manganese	+/-11.1%	101%
Nickel	+/-11.6%	105%
Vanadium	+/-11%	104%
Zinc	+/-10.6%	104%

Date Analyzed: 08-AUG-24 - 13-AUG-24

L633639 (Report ID: 1440631):
SOPs: ia-pcm(35)
Per NIOSH 7400, fiber counts less than 100 f/mm2 or greater than 1300 f/mm2 have a
greater than optimal variability and are probably biased.
Fiber count samples will be discarded 60 days from the date of this report.
The current intra-laboratory coefficients of variation (CVs) for the applicable fiber ranges are as
follows:
0.157 (5-20 fibers/100 fields)
0.116 (>20-50 fibers/100 fields)
0.087 (>50-100 fibers/100 fields)
0.098 (>100 fibers/100 fields)
The current inter-laboratory relative standard deviation is 0.45
The stated CVs apply to the media, technology, and SOP(s) referenced in the report and do not take
into account any uncertainty associated with the sampling process.
Results are corrected for the average blank value when blanks are submitted.

L633639 (Report ID: 1440492):
SOPs: ic-n5040(33)
Reported sample results in brackets are considered estimated, as they are below the level of quantitation.
Actual values for field blank are reported. Sample results have been corrected for the average field blank.

L633639-35-37 (Report ID: 1440492):
Carbon results may not be representative of entire filter. Heavier dust deposit present in center of
filter. A subsample from the darkest portion was analyzed. Results may be biased high.

L633639 (Report ID: 1440492):
Accuracy and mean recovery data presented below is based on a 95% confidence interval (k=2). The estimated accuracy applies to the
media, technology, and SOP referenced in this report and does not account for the uncertainty associated with the sampling process.
The accuracy is based solely on spike recovery data from internal quality control samples. Where N/A appears below, insufficient
data is available to provide statistical accuracy and mean recovery values for the associated analyte.

Parameter	Accuracy	Mean Recovery
Diesel Particulate Matter as Carbon	+/-10.8%	103%

L633639 (Report ID: 1440341):
SOPs: GRAV-SOP-6(28), GRAV-SOP-5(35)

L633639-31 (Report ID: 1440341):
Filter received torn at the laboratory. Results may be biased low.

Parameter	Accuracy	Mean Recovery
Total Dust	+/-7.1%	106%

L633639 (Report ID: 1441287):
The reported RCS value is based on recoveries of silica polymorphs (Quartz, Cristobalite, and/or Tridymite) greater than the reporting level. The presence of silica below the reporting level cannot be ruled out. When all polymorph results are below the reporting level, RCS defaults to the lowest polymorph concentration. The calibration standard used for Tridymite analysis is not NIST traceable; however, when Tridymite is detected above the reporting level, it is included in the RCS calculation.
SOPs: ix-calibrate(19), ix-xrdreview(23), ix-xrdashprep(50), ix-xrdstdprep(39)
The Primary Quartz blank spike duplicate recovery was outside the control limits of 71.2% to 108% at 70.2%.
Where possible, control limits are statistically generated in-house. In the absence of statistical limits, guidance default limits of 75.0% to 125% are used.The Quartz blank spike recovery was within control limits.

L633639-28 (Report ID: 1441287):
Elevated Quartz reporting limit due to matrix interference.

L633639-31 (Report ID: 1441287):
Filters received torn at the laboratory. Results may be biased low.

I. Introduction

Guzi-West Inspection and Consulting, LLC (Guzi-West) was retained in May 2024 to provide environmental consulting services for the subject facility, Coffin Butte Landfill (CBL). CBL is located at 28972 Coffin Butte Road, Corvallis, OR 97330; see Figure 1, Appendix A. The CBL is owned and operated by Valley Landfills, Inc. (VLI). This report of findings presents the results of an independent review of the facility's management and permitting compliance of the landfill gas, methane, as well as if methane generation is likely to pose health concerns for the surrounding community. As explained in further detail below, our review focuses on monitoring events and corresponding reports from the third quarter of 2022 to the second quarter of 2024. Total methane production by the landfill and modeling of methane dispersement throughout the site and beyond are outside our scope of work. The report's findings, conclusions, and recommendations will not be submitted to regulatory agencies and/or other parties outside of VLI, unless Guzi-West is specifically authorized to do so by VLI. Guzi-West prepared the report in conjunction with GHD, a global, multidisciplinary professional services firm with expertise in the environmental, engineering, architecture, and design and construction fields. The Sections below present the air quality regulations governing the landfill; how the landfill controls, manages, and monitors methane and other landfill gases; the regulatory compliance record of CBL specific to methane; potential health effects of methane, carbon dioxide, and other landfill gases; and finally conclusions and recommendations. Again, this report primarily focuses on methane alone, but other landfill gases are briefly discussed where appropriate.

II. Regulatory Background

The facility began accepting waste in 1978, has a design capacity of approximately 39.7 million tons, and a projected closure date of 2041. The subject facility is regulated under numerous regulatory permits and as such numerous Plans, Manuals, and Documents go into varying levels of details based upon their specific topics; the additional Plans, Manuals, and Documents are available under separate cover by request. The primary regulations specific to air quality and the subject scope of work are as follows: the Clean Air Act (CAA), the National Emission Standards for Hazardous Air Pollutants (NESHAPs), the New Source Performance Standards (NSPS), and the landfill gas emission requirements specified within Oregon Administrative Rules (OAR) Chapter 340, Division 239. Title V of the CAA requires each state to develop a comprehensive operating permit program for major industrial sources of air pollution. Oregon's Department of Environmental Quality (DEQ) is the governing body responsible for enforcing facilities subject to Title V within the state of Oregon. CBL is an active municipal solid waste landfill (MSWLF) operating under Oregon DEQ Title V Operating Permit No. 02-9502-TV-01. CBL's Title V Permit was issued October 30, 2009 and was set to expire October 1, 2014 but has been administratively extended by Oregon DEQ to date; a copy of the permit is provided in Appendix B. The facility's Title V Permit imposes emission limits and standards, testing, monitoring, and recordkeeping requirements specified under the CAA, NESHAPs, and NSPS.

On March 10th, 2020, Oregon Governor, Kate Brown, signed Executive Order No. 20-04 which directed state agencies to reduce and regulate greenhouse gas emissions. In an effort to meet the Governor's directive, the Oregon Environmental Quality Commission (EQC) and DEQ subsequently conducted a formal Landfill Gas Emissions rulemaking where they evaluated regulations in effect in neighboring states and their approaches to regulating and reducing greenhouse gas emissions. This led to the adoption of Oregon-specific landfill gas emission rules.

CBL maintains greater than or equal to 200,000 tons of waste-in-place and as such is required to adhere to the emission limits and standards, testing, monitoring, and recordkeeping requirements specified within OAR Chapter 340 Division 239 (OAR 340-239), the conditions specified within OAR 340-239 are notably more stringent than federal regulations specified under the CAA, NESHAPs, and NSPS. Due to the increased requirements, CBL retained SCS Field Services (SCS-FS) in the Fall of 2022 to complete the required Surface Emissions Monitoring (SEM). As detailed in SCS-FS's quarterly reports and summarized immediately below, the following requirements are stricter than the NESHAP regulations and require additional compliance.

SURFACE EMISSION METHANE CONCENTRATION LIMITS

340-239-0200 (1) Surface Emission Methane Concentration Limits. Except as provided in OAR 340-239-0110(4), 340-239-0110(5), 340-239-0300, and 340-239-0600(1), beginning August 1, 2022, or upon commencing operation of a newly installed gas collection and control system or modification of an existing gas collection and control system pursuant to OAR 340-239-0110(1), whichever is later, no location on the landfill surface may exceed either of the following methane concentration limits:

> *(a) 500 parts per million by volume (ppmv), other than nonrepeatable, momentary readings, as determined by instantaneous surface emissions monitoring conducted in accordance with OAR 340-239-0800(3)(b);*
>
> *(b) An average methane concentration limit of 25 ppmv as determined by integrated surface emissions monitoring conducted in accordance with OAR 340-239-800(3)(c).*

The 500 ppmv limit is an existing requirement under Federal regulations, however the average methane concentration limit of 25 ppmv is unique to OAR 340-239.

SURFACE EMISSION RECORDKEEPING

340-239-0700 A landfill owner or operator subject to this division must maintain the following records for at least five years:

- *340-239-0700(2)(a)(C) All instantaneous surface readings of 100 ppmv methane or greater. All exceedances of the limits in OAR 340-239-0100(6)(b) and 340-239-0200, including the location of the leak (or affected grid), leak concentration in ppmv methane, date and time of measurement, the action taken to repair the leak, date of repair, any required remonitoring and the remonitored concentration in ppmv methane, wind speed during surface sampling, and the installation date and location of each well installed as part of a gas collection system expansion;*

The Federal regulations only require monitored surface emissions over 500 ppmv to be documented, thus recordkeeping is now kept on emission points 100 ppmv or over. All repeatable instantaneous records of 100 ppmv or higher (taken during SEM) must be kept for 5 years AND recorded in the semi-annual reports.

Guzi-West's compliance review for the subject facility is presented in Section IV and focuses on CBL's compliance record when the more stringent rules under OAR 340-239 became effective in the third quarter of 2022.

III. Landfill Gas Collection & Control System (GCCS)

All municipal waste landfills produce landfill gases and must utilize engineering controls to manage and control their production. Typically, landfill gases comprise a mixture of methane 45%-60% and carbon dioxide 40%-60% by volume. Common contaminant gases and the processes by which they are generated include:

- methane generated from the decomposition of organic materials by bacterial action under anaerobic conditions;
- carbon dioxide typically generated by oxidation of methane in aerobic layers surrounding the landfill;
- other gases, including sulphur dioxide, helium, hydrogen, and gaseous alkanes and alkenes associated with wastes and degradation products within the landfill;
- and organic vapours associated with the presence of petroleum and other hydrocarbon products.

CBL maintains landfill gases (LFG) via the utilization of a gas collection and control system (GCCS). A new GCCS Design Plan was prepared by Energyneering Solutions and submitted to CBL on December 9, 2021 in order to meet new requirements specified within OAR 340-239. A copy of the Plan is included in Appendix C, and the description presented herein is based upon the information presented within the Plan. Generally speaking, a network of extraction wells and vertical and horizontal piping are utilized to capture LFG and route it to the nearby electrical generation plant owned and operated by the Pacific Northwest Generating Cooperative (PNGC); see Figure 2, Appendix A. A Master Design Plan exists for the facility's GCCS in order to accommodate placement of additional components as additional waste is placed into new landfill cells, see Appendix C.

The operation of CBL's GCCS has been designed in accordance with 340-239-0110(1)(c)(C) in order to handle the maximum expected gas flow rate from the entire area of the landfill that warrants control over the intended use period of the gas control or treatment system equipment. Because CBL already had an established GCCS, it was capable of calculating the actual maximum gas flow rate using the equation from 40 CFR 60.755(a)(1)(ii). The maximum expected LFG flow rate for the site was used for sizing the GCCS. The LFG generation rate calculations were performed using the United States Environmental Protection Agency (EPA) Landfill Gas Emission Model (LandGEM) (values - k=0.04/year and L0=80 m3/Mg), historical waste receipts and the permitted design capacity of the facility. The maximum LFG generation rate is projected to be approximately 6900 standard cubic feet per minute (SCFM). The LandGEM emissions model is a design tool which uses the information available to project future operating conditions. This model was developed based upon operating conditions at a cross-section of landfills within the United States and is approved for use by the EPA. Actual operating parameters may dictate changes in the system flow characteristics and process equipment as the system is developed. The LandGEM model meets the requirements of OAR 340-239-0110(2).

As of 2021, the GCCS specifically consisted of 312 active vertical extraction wells and horizontal collectors that each adhere to a 55 feet minimum depth and 15 feet minimum spacing between wells. The GCCS includes LFG piping capable of maintaining an adequate vacuum even under maximum load of gases, trenching & sloping that consists of a 3% grade to ensure proper drainage of liquids towards the landfill, and wellheads equipped with positive closing throttle valves, and two sampling ports to measure oxygen and nitrogen concentrations. All aspects of the GCCS have

been constructed using PVC, high density polyethylene (HDPE) pipe, fiberglass, corrosion resistant steel, neoprene gaskets, and other non-porous corrosion resistant materials. Condensate that forms in the GCCS piping is discharged to the leachate collection system (LCS) via direct connections to LCS clean/access riser or to condensate pump stations located around the perimeter of the disposal area. Condensates are disposed of with landfill leachate in accordance with the requirements of the facility Solid Waste Permit. Again, collected LFG is directed to an electrical generation plant owned and operated by the Pacific Northwest Generating Cooperative (PNGC) which consists of three 3516 Caterpillar engines and two 3520 Caterpillar engines; the engines are respectively capable of combusting approximately 287 SCFM and 527 SCFM each. PNGC's system also includes two backup utility flares to handle excess LFG totaling 3,000 SCFM. Essentially, LFG is captured by the GCCS and routed to the PNCG power plant where it's utilized to generate power; excess LFG, if present, is routed to the facility utility flares. Flare exhaust and LFG flow rates are continuously monitored using a thermocouple installed at the flare tip and an orifice plate along LFG pipes downstream of the flare system in accordance with OAR 340-239-0110 (2)(c)(A)(ii)(I).

IV. CBL Methane Monitoring and Regulatory Compliance Record Review

CBL is required to adhere to the Clean Air Act (CAA), the National Emission Standards for Hazardous Air Pollutants (NESHAPs), the New Source Performance Standards (NSPS), and the landfill gas emission requirements specified within OAR 340-239. The most stringent standards must be adhered to and at this time the conditions specified within OAR 340-239 are equally or more stringent than the conditions specified in the CAA, NESHAPs, and the NSPS. OAR 340-239 references three primary types of surface emission measurements for methane: instantaneous, integrated, and pressurized piping and/or components. Instantaneous measurements are collected at a specific location and time, while integrated measurements are averages of several measurements across an area or grid. Concentration limits for instantaneous and integrated measurements are specified within OAR 340-239 where additional monitoring requirements and corresponding corrective actions are imposed based upon exceedances of the established limits. The flowchart presented in Appendix D depicts how exceedances over given limits trigger additional follow-up monitoring, tighter monitoring grids, and requirements for GCCS system expansion if the follow-up monitoring identifies remaining exceedances. For instance, should any measurements from instantaneous or integrated routine monitoring be in exceedance of the instantaneous methane limit of 500 ppmv and/or the integrated methane limit of 25 ppmv, the first re-monitoring event must occur 10-days from the initial exceedance. If the first re-monitoring event finds a second exceedance over the 500 ppmv or 25 ppmv threshholds, a second re-monitoring must be performed within 10 days. If the second re-monitoring identifies exceedances over the 25 ppmv integrated threshholds, GCCS system expansion must be performed no later than 120 days after the date the third exceedance was identified. Instantaneous exceedances are re-monitored in an initial 10-day monitoring period, 2nd 10-day monitoring period, as well as a 1-month follow-up monitoring period; GCCS system expansion must be performed no later than 120 days after the date the fourth exceedance was identified. Similarly, GCCS pressurized piping and/or components containing landfill gas under positive pressure must also be monitored for leaks. If a component leak is found exceeding 500 ppmv methane, it must be tagged and repaired within 10 days. The flowchart provided in Appendix D identifies additional requirements/actions for methane concentrations found between 100-499 ppmv, <100 ppmv. <25 ppmv and provides a visual representation of the instantaneous and integrated monitoring process.

As previously noted, Surface Emissions Monitoring (SEM) at CBL is conducted by SCS Field Services (SCS-FS) and in accordance with OAR 340-239 requirements. Per SCS-FS documentation, the subject facility is divided into a grid of 105 separate 50,000 square foot areas; see Figure 3, Appendix A for an aerial photograph of the landfill with an overlay of the 105 separate grids. Surface emissions readings are recorded every five seconds while SCS-FS personnel walk monitoring pathways through the 105 grids. Meanwhile, instantaneous measurements are collected from cracks, holes, and other cover penetrations in the surface. Any instantaneous measurements exceeding the 100 or 500 ppmv standards (reporting and compliance levels, respectively) are GPS tagged and stake-marked for onsite personnel to perform remediation or repairs. The integrated averages for each grid are based on the readings collected every 5 seconds and stored on the instrument. The readings are downloaded, and the averages calculated for each grid using SCS eTools®. The most recent SCS-FS quarterly SEM report (Q2 2024) specifies monitoring is being performed on 25-foot pathways based on a prior inspection, in which exceedances were observed. As stipulated in OAR, if uncorrectable exceedances within the 10-day limitation are detected or emissions are discovered during an inspection by Regulatory Agencies, the landfill must perform monitoring on a 25-foot pathway on a quarterly basis for active disposal sites. Upon completion of four consecutive SEM events without an uncorrectable exceedance of the 25 ppmv or 500 ppmv standards, other than non-repeatable momentary readings, the landfill may perform the quarterly monitoring on a 100-foot spacing. Figure 4, Appendix A, depicts the monitoring pathway utilized by SCS-FS during the most recent field monitoring events conducted on June 11, 16, 18, 24, 26, and July 6, 16, and 26, 2024. The monitoring equipment includes a Thermo Scientific TVA 2020 Portable Flame Ionization Detector (FID) and a Weather Anemometer. The FID measures airborne methane between 1-50,000 ppmv and is calibrated in accordance with EPA Method 21. The Weather Anemometer records the weather conditions onsite, ensuring accurate measurement conditions (monitoring cannot be performed in wind exceeding 10mph or rain). To collect measurements, the FID inlet is held within 2 inches of the landfill surface while walking the grid in parallel paths. During monitoring for the pressurized pipe and components, the FID inlet is held a half inch from the component. Instantaneous monitoring results are recorded onsite if a reading above the 100 ppmv reporting threshold or the 500 ppmv compliance threshold is noted. Again, integrated monitoring results are calculated from the measurements collected every five seconds while SCS-FS traverses monitoring paths within each established grid; the measurements are stored on the FID and subsequently averaged to determine an integrated average for each of the 105 grids. The compliance summary presented below focuses on CBL's compliance record when the more stringent rules under OAR 340-239 became effective in the third quarter of 2022. Table 1, Appendix E, identifies the monitoring period, instantaneous, integrated, and pressurized piping and/or component monitoring results broken down by 'initial', '1st 10-day re-monitoring', '2nd 10-day re-monitoring', '1-month re-monitoring' (instantaneous only), as well as any notes made during Guzi-West's review.

Monitoring and determining compliance for an active landfill is uniquely challenging in that new material is constantly being added, settling, and decaying, which results in the generation of increasing amounts of landfill gas. OAR 340-239 appears to provide a structure for more frequent and stringent monitoring of landfill gas generation where initial exceedances are warning signs that trigger tighter monitoring pathways, frequency, recordkeeping, etc. Close follow-up is required for re-monitoring to determine if the landfill was able to implement corrective actions to reduce the initial exceedance below regulatory thresholds. In the event the exceedances remain above the thresholds for consecutive monitoring events, then corrective actions, ultimately involving system expansion, must be implemented. Thus, exceedances appear to be a relatively

expected outcome when operating an active municipal solid waste landfill. In our interpretation, the goal of OAR 340-239 is to cumulatively reduce landfill gas generation within the State of Oregon, thereby reducing greenhouse gas emissions within the state, by requiring landfill operators to more closely monitor and manage landfill gas generation. In that sense, we expect CBL's 'compliance' to be measured as much by the implementation of corresponding corrective actions after an exceedance, as by the record of compliance/exceedance of emission measurements alone.

As depicted on Table 1, Appendix E, eight individual quarters were evaluated for CBL during our review (Q3 2022 – Q2 2024) and instantaneous and/or integrated exceedances were identified in each of the eight quarterly monitoring events. Five quarters had individual exceedances which remained above regulatory threshold from the initial monitoring, 1st 10-day re-monitoring, 2nd 10-day re-monitoring, and 1-month re-monitoring events thereby requiring system expansion. Six quarters had integrated exceedances which remained above regulatory threshold from the initial monitoring, 1st 10-day re-monitoring, and the 2nd 10-day re-monitoring events thereby requiring system expansion. CBL, in turn, performed gas collection and control system expansions within 120 days following each individual and/or integrated exceedance during the subject review period (Q3 2022 – Q2 2024).

Due to the previously mentioned challenge of assessing landfill gas production for an active landfill, Guzi-West felt comparisons to other Oregon landfills would give the best representation of if CBL's methane exceedances and accompanying corrective actions were typical in the industry or not. Guzi-West submitted a freedom of information act request to the Oregon DEQ on October 31, 2024 for quarterly SEM reports from the third quarter of 2022 to the second quarter of 2024 for the Columbia Ridge, Knott, and Roseburg Landfills; all of which are representative landfills for comparison. Initially, a single quarterly SEM report was provided for Q2 2024 for the Roseburg Landfill; all other reports provided were annual and semi-annual summary reports. Unfortunately, the annual and semi-annual reports do not contain the level of detail quarterly reports do and thus statistical comparisons were generally not possible. Specifically, the annual and semi-annual reports do not include, and are not required to, the total number of integrated and instantaneous measurements for a given monitoring event, definitions for single measurements, etc. (i.e. the reports typically provide summaries of the number of total exceedances, but not how many overall measurements were collected for a given monitoring event where statistical analyses could be calculated and compared between landfills). Guzi-West made numerous additional requests for quarterly reports for the additional landfills; ultimately, Oregon DEQ Air Quality Permit Coordinator, Cynthia Ferris, explained that, "Generally, the SEM reports are hidden within the annual and semi-annual reports. We don't receive separate reports from the facilities each quarter. The permit only requires reporting of instantaneous surface methane readings greater than 100 ppm (Condition 51.a.i) and says nothing of reporting the integrated measurements, so we may not have that information, but the source is required to keep those records." Essentially, what is contained in the annual and semi-annual reports is all that is required to be kept by Oregon DEQ and by extension all that can be requested from them. Nevertheless, the one quarterly SEM report that was provided was the Q2 2024 report from the Roseburg Landfill does provide a direct comparison for a randomly selected snapshot in time; a copy of the report is provided in Appendix F. Both CBL and Roseburg Landfill are municipal solid waste landfills, with Roseburg Landfill being roughly a fifth of the size of CBL. Further, SCS Engineers performs the surface emissions monitoring at the Roseburg Landfill, the same firm that performs surface emissions monitoring for CBL, making it ideal for comparison as similar or identical equipment, employees, and standard operating procedures were utilized. We recognize and acknowledge comparison of a single

quarterly event is insufficient to determine compliance over time between the two facilities; however, the goal of making the comparison is to gauge what is typical in the industry. Even comparison of a single monitoring event can provide the general public, report readers, and CBL staff a valuable assessment of how CBL compares against industry peers. It should be noted the EPA collected instantaneous measurements for the CBL during the second quarter of 2024, but did not for the Roseburg Landfill. The most representative method of comparing the landfills is to utilize data only collected by SCS-FS due to the reasons specified above regarding the same employees, standard operating procedures, etc.; regardless, the data is presented and analyzed both including and excluding the EPA data. As shown in Table 2, Appendix E, 63% of the instantaneous measurements collected from the Roseburg Landfill exceeded the 500 ppmv methane limit in the initial monitoring event (12 of the 19 instantaneous measurements) compared to 56% of the CBL for the same period (22 of the 39 instantaneous measurements). If the EPA measurements are included for CBL, 78% of the instantaneous measurements exceeded the 500 ppm methane limit (63 of the 80 measurements). The Roseburg Landfill did not have any exceedances of the integrated methane limit, 25 ppm, and 42 grids were monitored out of the total 54 grids present. Grids are not monitored, or required to be, if active landfill operations are occurring in a given grid. Meanwhile, 7% of the CBL integrated grids monitored exceeded the integrated methane limit (3 of the 42 grids monitored). No integrated measurements were collected/calculated by the EPA.

The second component analyzed was how quickly were the instantaneous and integrated exceedances able to be corrected by either facility. The Roseburg Landfill was able to implement corrective actions wherein the first 10-day re-monitoring event showed no exceedances of the instantaneous limit remained; CBL was unable to implement successful corrective actions for 16 of the 17 instantaneous exceedances and system expansion was required in those areas. CBL was able to implement corrective actions for the integrated exceedances and all 3 integrated exceedances returned to below methane limits within the first 10-day monitoring event. Generally speaking, the number of exceedances between the two facilities is comparable, while the Roseburg Landfill was able to implement corrective actions more quickly to resolve the issues identified in the instantaneous exceedances. CBL was able to implement corrective actions to resolve the exceedances of the integrated limit, but the instantaneous exceedances identified led to the expansion of the gas collection and control system as corrective actions were unable to be implemented within one month. In summary, we expect this comparison to be typical of the industry where some landfills will have more exceedances than others in given quarters; corrective actions will be quickly and easily implemented for some areas where exceedances are required while other exceedances will identify areas wherein system expansion is required. Our interpretation remains that the regulation, by design, is meant to encourage continuous adaptive solutions to identified problems as the need arises. The triggers for re-monitoring and eventually system expansion are in place to allow a facility to attempt to rectify exceedances with small scale solutions until it becomes apparent that the system itself needs additional resources to handle the amount of gas that the landfill is producing. The purpose of the regulation is not to prevent exceedances, it is to use the identification of exceedances as a guide to address the facility's gas collection and control needs.

V. Potential Health Effects of Methane, Carbon Dioxide, and Other Landfill Gases

CBL requested Guzi-West objectively review the site's generation of the landfill gas, methane, and any potential health effects it could pose to the community surrounding the facility. Presented below is a discussion of the typical health effects associated with landfill gases, regulatory limits and health-based goals for the primary landfill gases (methane and carbon dioxide), the exposure paths landfill gases typically follow, and finally an evaluation of the subject facility's potential impacts to the community.

The primary gases produced by a landfill are methane and carbon dioxide making up 99%, or greater, of gases typically produced. In addition to methane and carbon dioxide, landfill gases can also contain trace amounts of other gases, including volatile organic compounds (VOCs) and hazardous air pollutants. According to the Agency for Toxic Substances & Disease Registry (ATSDR) (a federal public health agency of the U.S. Department of Health and Human Services), the short-term and long-term effects associated with landfill gases can include the following:

1. **Short-Term Effects**:
    - Odors: Unpleasant odors from sulfur compounds can cause headaches, nasal congestion, eye, nose, and throat irritation, cough, and nausea.
    - Respiratory Issues: Exposure to landfill gas can exacerbate asthma and other respiratory conditions.
    - Direct Exposure: People living near landfills may experience skin irritation or dermatitis from contact with contaminated soil or water.
    - Eye Irritation: Gases like H_2S can cause eye irritation, redness, and watering.
2. **Long-Term Effects:**
    - Mental Health: Persistent odors and health concerns can lead to stress and anxiety among community members.
    - Carcinogenic Risks: Though they are normally only present in landfill gas in small quantities and therefore unlikely to cause any community health effects, it is well known that VOCs such as benzene and other non-methane organic compounds pose a carcinogenic hazard to human health.
    - Chronic Exposure: Prolonged exposure to low levels of certain VOCs can lead to more serious neurological effects, including cognitive impairments.

Methane and carbon dioxide are both classified as simple asphyxiants meaning that, within enclosed areas, either gas can build up and displace oxygen creating an oxygen deficient atmosphere. Further, methane is considered a flammable gas while carbon dioxide is not. Regulatory limits and health-based values for both gases are discussed immediately below. The Occupational Safety and Health Administration (OSHA) defines an oxygen deficient atmosphere as an oxygen content below 19.5% by volume. OSHA has not established a Permissible Exposure

Limit (PEL) for methane; however, OR-OSHA has an established methane PEL of 1,000 parts per million (ppm) when evaluated as an 8-hour time weighted average, a 30-minute excursion limit of 3,000 ppm (3x the PEL), and a ceiling limit of 5,000 ppm (5x the PEL). Federal OSHA and OR-OSHA have established the same PEL for carbon dioxide at 5,000 ppm (0.5% CO2 in air) averaged over an 8-hour workday, and OR-OSHA has further established 15,000 ppm as a 30-minute excursion limit (3x the PEL), and a ceiling limit of 25,000 ppm (5x the PEL). Per the National Institute for Occupational Safety and Health (NIOSH), methane is considered a flammable gas with a lower explosive limit (LEL) of 5% by volume and an upper explosive limit (UEL) of 15% by volume. NIOSH has established health-based immediately dangerous to life or health (IDLH) values which are set at 10% of the LEL for specific air contaminants, including methane, because the explosive hazards are deemed a greater risk; the IDLH for methane is 5,000 ppm (10% of the LEL for methane, which is 50,000 ppm). Carbon dioxide has an established IDLH of 40,000 ppm.

There are generally considered two main exposure paths that landfill gases can take to affect community health:

1. **Subsurface Migration**: Gases can move through the soil and enter structures or utility corridors adjacent to the landfill. These exposure routes can be mitigated and reduced by appropriate design of landfill gas collection systems and equipment as well as regular air quality monitoring. The 2021 Gas Collection and Control System Design Plan prepared by Energyneering Solutions (Appendix C) depicts and describes how landfill gases are captured, monitored, and reported in detail.

2. **Ambient Air**: Gases can migrate from the landfill surface into the surrounding air, carried by the wind. Figure 5, Appendix A, identifies the parcels owned by CBL, as well as parcels of surrounding property owners.

Subsurface migration of methane is a well-known concern for landfill facilities; again, the facility's gas collection and control system (Appendix C) addresses the engineering design for collection of landfill gases facility-wide, specifies how subsurface methane migration is monitored and reported, and identifies future expansion of the system. Each month CBL personnel measure methane concentrations down to 0.1% in six landfill gas probes installed in-ground to monitor any subsurface migration of landfill gases. As depicted in Figure 6, Appendix A, the sub surface gas probes are located along the south-southwestern portion of the landfill wherein CBL has gas and leachate collection lines are routed throughout the landfill to the PNGC power facility. No other power lines or other public utilities are present within the footprint of the CBL facility (i.e. the only subsurface utilities on-site are those associated with CBL's landfill gas and leachate collection system). In addition to the probe monitoring, each month CBL personnel measure methane concentrations down to 0.1% in the interiors of eight site buildings and structures owned and utilized by CBL. The monitoring results for landfill gas monitoring, including those associated with landfill gas probes around the perimeter of the landfill, are reported annually in the facility's Annual Environmental Monitoring Report. Based upon electronic records from 2006 to 2023, as well as an anecdotal information provided by Ian Macnab, CBL Environmental Manager, methane has not been detected in any monthly monitoring event within the six probes, nor within the interiors of the eight buildings and structures since at least 2006. Records prior to 2006 were not reviewed.

The second potential route of community exposure is migration through ambient air wherein landfill gases can escape from the landfill surface and be carried by the wind into the community.

This appears to be a significant concern in the community based upon local reporting where references to instantaneous measurements with concentrations exceeding 100,000 ppm have been identified on-site. Evaluating potential community impacts with instantaneous readings is inferior in our opinion to utilizing integrated readings. Instantaneous readings are typically collected from a given area of concern (i.e. a hole in a landfill liner, below temporary tarps and cover, etc.) and represent 'hot spots' wherein measurements are collected to determine if immediate corrective actions are required. This is demonstrated in the previously referenced CBL Q2 2024 SEM report where the EPA identified a methane concentration of 118,265 ppm in an instantaneous reading collected on June 26, 2024, from location A20 (this measurement is the highest single measurement ever identified from Q3 2022 to Q2 2024). As required by OAR 340-239, the same location was subsequently remeasured on July 6, 2024, following implementation of corrective actions and a methane concentration of 27 ppm identified. Similarly, the EPA identified 41 instantaneous readings above 500 ppm in their June 26, 2024 field inspection, all but 2 of those locations had fallen below 500 ppm when remeasured on July 6, 2024. In contrast, the integrated monitoring utilizes 105 separate grids divided evenly across the landfill, and methane measurements are automatically collected every five seconds with an FID as field personnel systematically traverse across the defined grids collecting measurements within 2-inches of the landfill surface. Averages are then calculated for each grid utilizing thousands of individual methane measurements and each grid average then compared against the 25 ppmv methane limit. By averaging thousands of measurements, the high measurements are still included but their significance can be seen as a whole for the entire grid, as well as for the landfill as a whole. For these reasons we believe the integrated monitoring measurements are the superior data set to evaluate the landfill's cumulative methane generation and potential impacts to the community. The modeling of landfill gas migration is beyond our scope of work; however, landfill gases are well known to dissipate in ambient air the further away one travels from the landfill/source. Therefore, to provide a general understanding of the likelihood of impacts to the community, Guzi-West identified the highest integrated methane level identified for a given grid to date and subsequently compared that grid to the regulatory limits and health-based goals in order to provide a worst case scenario analysis specific to methane. That is, comparing the highest integrated methane concentrations identified on-site provides a worst-case scenario analysis as the concentrations are known to dissipate in ambient air as you move away from the landfill itself and toward the property boundary and the surrounding community. Since integrated monitoring began to be required under OAR 340-239 (third quarter of 2022), the highest average measurement for any single grid was 217.64 ppmv as measured during the second quarter of 2023; this is 4.5 times below the OR-OSHA PEL for methane (1,000 ppm), 22 times below the IDLH for methane (5,000 ppm), and 229 times below the lower explosive limit for methane (50,000 ppm).

VI. Conclusions and Recommendations

Guzi-West's scope of work focused on evaluating the subject facility's permitting compliance specific to the landfill gas, methane, in addition to evaluating if methane gas production from the facility is posing a health risk to the surrounding community. Our evaluation was done against the backdrop of a relatively newly implemented Oregon rule (OAR 340-239), which imposed more stringent requirements specific to landfills and methane production, monitoring, recordkeeping and reporting. As previously mentioned, monitoring and determining compliance for an active landfill is uniquely challenging in that new material is constantly being added, settling, and decaying, resulting in the generation of increasing amounts of landfill gas. Eight consecutive

quarterly reports were reviewed for the subject site starting in quarter three of 2022 and ending in quarter two of 2024; CBL had repeated individual exceedances in five quarters and repeated integrated exceedances in six quarters, which collectively triggered corrective actions and/or system expansion to be performed. As required by OAR 340-239, CBL implemented corrective actions within 120 days for each area wherein exceedances were identified. Guzi-West felt comparisons to other Oregon landfills would give the best representation of if CBL's methane exceedances and accompanying corrective actions were typical in the industry or not. Although obtaining quarterly reports for numerous landfills for the same monitoring period proved impossible, a quarterly SEM report from Roseburg Landfill was able to be obtained and provided a direct comparison for a representative facility. The number of exceedances between the two facilities was comparable, while the Roseburg Landfill was able to implement corrective actions more quickly to resolve the issues identified in the instantaneous exceedances for the subject monitoring period. In the end, we anticipate this comparison to be typical of the industry wherein some landfills will have more exceedances than others in given quarters; corrective actions will be quickly and easily implemented for some areas where exceedances are required while other exceedances will identify areas wherein system expansion is required. Our interpretation remains that the purpose of the regulation is not to prevent exceedances, it is to use the identification of exceedances as a guide to address the facility's gas collection and control needs. CBL is operating in compliance with OAR 340-239, and we expect their monitoring, reporting, and overall compliance record to be similar to that of their industry peers.

In the evaluation of landfill gases and potential impacts to the community surrounding the CBL facility, Guzi-West first assessed the potential exposure pathways landfill gases could follow. No measurable methane concentrations have been identified migrating in the subsurface since at least 2006 in the closest and most likely areas where landfill gases would be expected to migrate. Therefore, we conclude it is very unlikely subsurface migration of landfill gases is occurring and potentially impacting the surrounding community. A methane concentration of 100,000 ppm or greater was identified at the facility and is well above the lower explosive limit for methane (50,000 ppm), however re-monitoring of the same location following implementation of corrective actions resulted in a concentration of 27 ppm. These measurements were taken during instantaneous monitoring which, while useful for identifying precise locations of methane release, is not representative of the broader system, a metric that integrated monitoring captures more accurately. Further, methane and carbon dioxide can cause potential hazards within confined spaces (either due to the creation of an oxygen deficient atmosphere, and/or in the case of methane, due to the creation of an explosive risk); that said, neither gas is expected to pose asphyxiation or explosive concerns in ambient air to the community surrounding CBL. This opinion is largely based upon the results of the integrated monitoring conducted at the subject facility, which began to be required under OAR 340-239 at the start of the third quarter of 2022. The highest average methane emission for any single CBL grid was 217.64 ppm measured during the second quarter of 2023; this is 4.5 times below the OR-OSHA PEL for methane (1,000 ppm), 22 times below the IDLH for methane (5,000 ppm), and 229 times below the lower explosive limit for methane (50,000 ppm). This risk is further reduced in ambient air the farther one travels away from the landfill. In conclusion, it doesn't appear methane or carbon dioxide are likely to be present at concentrations that pose any immediate health concerns to the surrounding community. Community concerns regarding increasing greenhouse gas emissions from landfills and all sources is outside the scope of this project.

Although OAR 340-239 does not specifically require mapping and a detailed description of what the system expansion consisted of, we recommend CBL personnel keep a log of the components making up the system expansion, implementation date/s, along with mapping of what was added. Appendix G serves as a placeholder for this documentation. We recommend CBL consider implementation/expansion of continuous air monitoring devices around the property boundary to monitor and guide corrective actions on-site in regards to air quality, as well as to demonstrate to the local community CBL's commitment to continuous compliance with applicable air quality regulations. This, along with consistent community engagement. appear to be the key in developing/re-establishing community trust, and showing that CBL is now, and will continue to operate within compliance of all regulatory permits at the site.

APPENDIX B

Title V Operating Permit (Coffin Butte Landfill)

Permit number: 02-9502-TV-01
Expiration date: 10/01/14
Page 1 of 29

OREGON DEPARTMENT OF ENVIRONMENTAL QUALITY
OREGON TITLE V OPERATING PERMIT

Western Region-Salem Office
750 Front Street NE, Suite 120
Salem, OR 97301-1039
Telephone (503) 378-8240

Issued in accordance with the provisions of ORS 468A.040
and based on the land use compatibility findings included in the permit record.

ISSUED TO:

Valley Landfills, Inc.
28972 Coffin Butte Road
Corvallis, OR 97330

INFORMATION RELIED UPON:

Application Number: 23594
Received: 01/30/09

PLANT SITE LOCATION:

Coffin Butte Landfill
Highway 99 & Coffin Butte Road
Corvallis, OR 97330

LAND USE COMPATIBILITY STATEMENT:

Issued by: Benton County
Dated: 03/06/97

ISSUED BY THE DEPARTEMENT OF ENVIRONMENTAL QUALITY

Claudia Davis

Claudia Davis, Western Region Air Quality Manager

OCT 3 0 2009
Date

Nature of Business: Municipal Solid Waste Landfill
SIC: 4953

RESPONSIBLE OFFICIAL

Title: General Manager
Alternate: Vice President

FACILITY CONTACT PERSON

Name: Brian May
Title: General Manager

LIST OF ABBREVIATIONS THAT MAY BE USED IN THIS PERMIT

ACDP	Air Contaminant Discharge Permit
Act	Federal Clean Air Act
ASTM	American Society of Testing and Materials
Btu	British thermal unit
CFR	Code of Federal Regulations
CO	Carbon monoxide
CPMS	Continuous parameter monitoring system
DEQ	Department of Environmental Quality
dscf	Dry standard cubic feet
EF	Emission factor
EPA	US Environmental Protection Agency
EU	Emissions unit
FCAA	Federal Clean Air Act
FSA	Fuel sampling and analysis
gr/dscf	Grain per dry standard cubic feet (1 pound = 7000 grains)
HAP	Hazardous Air Pollutant as defined by OAR 340-244-0040
HCFC	Halogenated Chloro-Fluoro-Carbons
H_2S	Hydrogen sulfide
ID	Identification number or label
I&M	Inspection and maintenance
LFG	Landfill gas
NA	Not applicable
NESHAP	National Emission Standard for Hazardous Air Pollutants
NMOC	Nonmethane organic compounds
NO_x	Nitrogen oxides
NSPS	New Source Performance Standards
O_2	Oxygen
OAR	Oregon Administrative Rules
ODEQ	Oregon Department of Environmental Quality
ORS	Oregon Revised Statutes
O&M	Operation and maintenance
Pb	Lead
PCD	Pollution control device
PM	Particulate matter
PM_{10}	Particulate matter less than 10 microns in size
ppm	Parts per million
PSEL	Plant Site Emission Limit
SIP	State Implementation Plan
SO_2	Sulfur dioxide
SSM	Startup, shutdown, malfunction
ST	Source test
VE	Visible emissions
VMT	Vehicle miles traveled
VOC	Volatile organic compounds

Modified EPA Method 9: As used in this permit "Modified EPA Method 9" is defined as follows:

> Opacity must be measured in accordance with EPA Method 9. For all standards, the minimum observation period must be six minutes, though longer periods may be required by a specific rule or permit condition. Aggregate times (e.g., 3 minutes in any one hour) consist of the total duration of all readings during the observation period that are equal to or greater than the opacity percentage in the standard, whether or not the readings are consecutive. Each EPA Method 9 reading represents 15 seconds of time. [See also the definition of "Opacity" in OAR 340-208-0010]

PERMITTED ACTIVITIES

1. Until such time as this permit expires or is modified or revoked, the permittee is allowed to discharge air contaminants from those processes and activities directly related to or associated with air contaminant source(s) in accordance with the requirements, limitations, and conditions of this permit. [OAR 340-218-0010 and 340-218-0120(2)]

2. All conditions in this permit are federally enforceable except as specified below:

   2.a. Conditions 6 through 12, G5, and G9 (OAR 340-248-0005 through 0180) are only enforceable by the state. [OAR 340-218-0060]

EMISSIONS UNIT (EU) AND POLLUTION CONTROL DEVICE (PCD) IDENTIFICATION

3. The emissions units regulated by this permit are the following [OAR 340-218-0040(3)]:

Table 1. EU and PCD IDENTIFICATION

Emission Unit Description	EU ID	Pollution Control Device Description	PCD ID
Landfill Gas Control System	Control	Open Flare	FL
Fugitive Landfill Gas, Cell 0	F-LFG1	None	NA
Fugitive Landfill Gas, Cells 1 to 4	F-LFG2	Landfill gas collection and extraction system	LFGCES-1
Vehicle traffic on paved roads	PIR	Water application	NA
Vehicle traffic on unpaved roads	UPR	Chemical suppressant and water application	NA
Tipper	TIP	None	NA
Petroleum contaminated soils	PCS	None	NA
Aggregate Insignificant activities:	AI		
Cell development, operation, and closing		None	NA
Wastewater treatment system operation		Baghouse	DC-1
Leachate collection and wastewater treatment		None	NA
Portable light plant		None	NA
Trash pumps		None	NA
Generator		None	NA

EMISSION LIMITS AND STANDARDS, TESTING, MONITORING, AND RECORDKEEPING REQUIREMENTS

The following tables and conditions contain the applicable requirements along with the testing, monitoring, and recordkeeping requirements for the emissions units to which those requirements apply.

Facility-wide Requirements

Table 2. Facility wide emission limits and standards

Applicable Requirement	Condition Number	Pollutant/ Parameter	Limit/Standard	Averaging Time	Testing Condition	Monitoring Condition
340-208-0210(2)	4	Fugitive emissions	Minimize	NA	NA	5
340-208-0300	6	Air contaminants	No nuisance	NA	NA	8
340-208-0450	7	PM >250μ	No fallout	NA	NA	8
340-248-0280(10)	9	Asbestos disposal	Handling procedures	Recordkeeping	NA	10
340-248-0280(11)	11	Asbestos cover	Maintain cover	Recordkeeping	NA	12

Fugitive Emissions

4. Applicable Requirement: The permittee must not allow or permit any materials to be handled, transported, or stored; or a building, its appurtenances, or a road to be used, constructed, altered, repaired, or demolished; or any equipment to be operated, without taking reasonable precautions to prevent particulate matter from becoming airborne. Such reasonable precautions must include, but not be limited to the following: [OAR 340-208-0210(2)]

   4.a. use, where possible, of water or chemicals for control of dust in the demolition of existing buildings or structures, construction operations, the grading of roads or the clearing of land;
   4.b. application of asphalt, oil, water, or other suitable chemicals on unpaved roads, materials stockpiles, and other surfaces which can create airborne dusts;
   4.c. full or partial enclosure of materials stockpiles in cases where application of oil, water, or chemicals are not sufficient to prevent particulate matter from becoming airborne;
   4.d. installation and use of hoods, fans, and fabric filters to enclose and vent the handling of dusty materials;
   4.e. adequate containment during sandblasting or other similar operations; and,
   4.f. covering, at all times when in motion, open bodied trucks transporting materials likely to become airborne.

5. Monitoring Requirement: At least once each week for a minimum period of 30 minutes, the permittee must visually survey the plant for any sources of excess fugitive emissions using EPA Method 22. For the purpose of this survey, excess fugitive emissions are considered to be any visible emissions generated by fugitive sources that leave the plant site boundaries. The person conducting the observation does not have to be EPA Method 9 certified. However, the individual should be familiar with the procedures of EPA Method 9, including using the proper location to observe visible emissions. If sources of visible emissions are identified, the permittee must: [OAR 340-218-0050(3)(a)]

   5.a. immediately take corrective action to minimize the fugitive emissions, including but not limited to those actions identified in Condition 4; or,
   5.b. conduct a Modified EPA Method 9 test within 24 hours;
   5.c. Recordkeeping: The permittee must maintain records of the fugitive emissions surveys, corrective actions (if necessary), and/or the results of any modified EPA Method 9 tests.

Nuisance Conditions

6. Applicable Requirement: The permittee must not cause or allow air contaminants from any source to cause a nuisance. Nuisance conditions will be verified by Department personnel. [OAR 340-208-0300] This condition is enforceable only by the State.

7. Applicable Requirement: The permittee must not cause or permit the emission of any particulate matter larger than 250 microns in size at sufficient duration or quantity, as to create an observable deposition upon the real property of another person. The Department will verify that the deposition exists and will notify the permittee that the deposition must be controlled. [OAR 340-208-0450] This condition is enforceable only by the State.

8. Monitoring Requirement: The permittee must maintain a log of each air quality complaint received by the permittee during the operation of the facility and must provide the Western Region-Salem Office of the Department with written notification within 5 days of all nuisance complaints regarding fugitive dust, odors, or particulate deposition received. Documentation shall include date of contact, time of observed nuisance condition, description of nuisance condition, location of receptor, status of plant operation during the observed period, and time of response to complainant. A plant representative must immediately investigate the condition following the receipt of the nuisance complaint and a plant representative must provide a response to the complainant within 24 hours, if possible. This condition is only enforceable by the State. [OAR 340-218-0050(3)(a)]

Asbestos Disposal and Cover

9. Applicable Requirement: The permittee must meet the asbestos-containing material handling and disposal requirements and procedures specified in OAR 340-248-0280(10) for active waste disposal sites. This condition is only enforceable by the state.

10. Monitoring Requirement: The permittee must monitor the asbestos-containing material handling and disposal procedures, provide notifications, and record the information required as specified in OAR 340-248-0280(10) for active waste disposal sites. This condition is only enforceable by the State.

11. Applicable Requirement: The permittee must meet the asbestos-containing material disposal and cover standards specified in OAR 340-248-0280(11) for inactive waste disposal sites. This condition is only enforceable by the State.

12. Monitoring Requirement: The permittee must monitor the asbestos-containing disposal and cover requirements and provide notifications as specified in OAR 340-248-0280(11) for inactive waste disposal sites. This condition is only enforceable by the State.

Facility Wide Requirements

13. The following requirements apply facility wide, including, but not limited to, the solid municipal waste landfill, unless an alternate requirement is specifically stated for a particular emissions unit.

Table 3. Summary of NSPS and NESHAP requirements:

Condition	Applicable Requirement	Description (for clarification purposes only, enforceable as listed under 'applicable requirement')	Monitoring and Analysis Procedure or Test Method	Monitoring, Recordkeeping, and Reporting Requirement
13.1	40 CFR 60.7(a)(4); 40 CFR 60.7(b); 40 CFR 60.7(f)	Notification and recordkeeping.	Maintain records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of the affected facility. Maintain a file of all measurements and performance testing measurements and all other information required by this part recorded in a permanent form suitable for inspection.	Permittee shall furnish prior written or e-mail notification of any physical or operational change which may increase the emission rate of any air pollutant (such as taking operating gas collection wells off line) to which a standard applies to: ODEQ, Western Region – Salem Office 750 Front Street NE, Suite 120 Salem, OR 97301-1039 [40 CFR 60.4(a)]
13.2	40 CFR 60.11(d)	Maintain and operate any affected emission unit with good air pollution control practice for minimizing emissions.	None specified.	No additional monitoring required.
13.3	40 CFR 60.12	Circumvention.	None specified.	No additional monitoring required.
13.4	40 CFR 60.752(b)(2)(ii)(A); 40 CFR 60.753(a); 40 CFR 60.755(b) (Landfill NSPS Subpart WWW)	Install, within 60 days, and operate active collection system wells that collect gas from each area, cell, or group of cells in the landfill in which solid waste has been placed for: (1) 5 years or more if active, OR (2) 2 years or more if closed or at final grade.	None specified.	No additional monitoring required.

Condition	Applicable Requirement	Description (for clarification purposes only, enforceable as listed under 'applicable requirement')	Monitoring and Analysis Procedure or Test Method	Monitoring, Recordkeeping, and Reporting Requirement
13.5	40 CFR 60.752(b)(2)(ii)(A) (Landfill NSPS Subpart WWW)	Install an active collection system that is designed to handle the maximum expected gas flow rate from the entire area of the landfill that warrants control over the intended use period of the gas control or treatment system equipment.	To calculate maximum expected gas flow rate: $Q_m = \sum_{i=1}^{n} 2kL_o M_i \left(e^{-kt_i}\right)$ where, Q_m=maximum expected gas generation flow rate, m^3/yr k=methane generation rate constant, $year^{-1}$ L_o=methane generation potential, m^3/Mg solid waste M_i=mass of solid waste in the i^{th} section, Mg t_i=age of the i^{th} section, years [40 CFR 60.755(a)(1)(ii)]	Submit monthly report to: ODEQ, Western Region – Salem Office 750 Front Street NE, Suite 120 Salem, OR 97301-1039 Monthly report shall include the date of installation and the location of each well or collection system expansion added. [40 CFR 60.757(f)]
13.6	40 CFR 60.752(b); 40 CFR 60.754(a); 40 CFR 60.757(b); 40 CFR 60.4(a) (Landfill NSPS Subpart WWW)	Calculate the NMOC emission rate for the landfill. If the calculated NMOC emission rate is less than 50 Mg/yr, the permittee shall recalculate the NMOC emission rate and submit emission reports to the Department until such time as the calculated NMOC emission rate is ≥ 50 Mg/yr, or the landfill is closed.	Calculate the NMOC emission rate: $M_{NMOC} = \sum_{i=1}^{n} 2kL_oM_i(e^{-kt_i})(C_{NMOC})(3.6x10^{-9})$ where, M_{NMOC}=Total NMOC emission rate from the landfill (Mg/yr) k=methane generation rate constant=0.05 yr^{-1} or as determined using Tier 3 per 40 CFR 60.754 (a)(4) L_o=methane generation potential=170 m^3/Mg solid waste M_i=mass of solid waste in the i^{th} section (Mg) t_i=age of the i^{th} section (yr) C_{NMOC}=4000 ppm per 40 CFR 60.754(a)(3) $3.6x10^{-9}$=conversion factor The mass of the nondegradable solid waste may be subtracted from the total mass of solid waste in a particular section of the landfill when calculating the value for M_i if properly documented. [40 CFR 60.754(a)(1)(i)]	The permittee shall submit an NMOC emission rate report to: ODEQ, Western Region – Salem Office 750 Front Street NE, Suite 120 Salem, OR 97301-1039 (1) annually, OR (2) if the estimated NMOC emission rate as reported in the annual report is less than 50 Mg/yr in each of the next 5 consecutive years, the permittee may elect to submit an estimate of the NMOC emission rate for the next 5-year period in lieu of the annual report. If option (2) is chosen, this estimate shall be revised at least once every 5 years. If the actual waste acceptance rate exceeds the estimated waste acceptance rate in any year reported in the 5-year estimate, a revised 5-year estimate shall be submitted to ODEQ at the address given above. The revised estimate shall cover the 5-year period beginning with the year in which the actual waste acceptance rate exceeded the estimated waste acceptance rate. The NMOC emission rate report shall include the current amount of solid waste-in-place and the estimated waste acceptance rate for each year of the 5 years for which an NMOC emission rate is estimated. The NMOC emission rate report shall include all the data, calculations, sample reports and measurements used to estimate the annual or 5-year emissions. ODEQ may request such additional information as may be necessary to verify the reported NMOC emission rate. [40 CFR 60.4(a); 40 CFR 60.757(b)]
13.7	40 CFR 60.752(b)(2)(ii)(A); 40 CFR 60.759(a); 40 CFR 60.759(b) (Landfill NSPS Subpart WWW)	Install an active collection system that is designed to collect gas at a sufficient extraction rate, sited at a sufficient density throughout all gas producing areas, and designed to minimize off-site migration of subsurface gas.	None specified.	Keep for the life of the collection system an up-to-date, readily accessible plot map showing each existing and planned collector in the system and providing a unique identification location label for each collector. Keep up-to-date, readily accessible records of the installation date and location of all newly installed collectors. [40 CFR 60.758(d)]

Condition	Applicable Requirement	Description (for clarification purposes only, enforceable as listed under 'applicable requirement')	Monitoring and Analysis Procedure or Test Method	Monitoring, Recordkeeping, and Reporting Requirement
13.8	40 CFR 60.753(b) (Landfill NSPS Subpart WWW)	Operate the LFG control system with negative pressure at each well-head except under the following conditions: (1) fire or increased well temperature; OR, (2) use of a geomembrane or synthetic cover; OR, (3) a decommissioned well. Passive gas collection wells do not have to meet this condition when approved in writing by the Department. Gas collection wells operating under an Alternative Operating and Monitoring Plan approved in writing by the Department do not have to meet this condition.	None specified.	Measure gauge pressure in the gas collection header at each individual well, monthly. If a positive pressure exists, action shall be initiated to correct the exceedance within 5 calendar days. If negative pressure cannot be achieved without excess air infiltration within 15 calendar days of the first measurement, the gas collection system shall be expanded to correct the exceedance within 120 days of the initial measurement of positive pressure. Any attempted corrective measure shall not cause exceedances of other operational or performance standards. [40 CFR 60.755(a)(3)] The annual report shall include record of instances when positive pressure occurred. [40 CFR 60.753(b)(1)]
13.9	40 CFR 60.753(c) (Landfill NSPS Subpart WWW)	Operate each interior wellhead in the LFG collection system with: (1) LFG temperature <55°C; AND, (2) either: (a) N_2 < 20%; OR, (b) O_2 < 5%. Passive gas collection wells do not have to meet this condition when approved in writing by the Department. Gas collection wells receiving a variance in writing from the Department concerning temperature do not have to meet this condition. Gas collection wells operating under an Alternative Operating and Monitoring Plan approved in writing by the Department do not have to meet this condition.	N_2 by RM 3C; O_2 by RM 3A, except that: (1) regulatory limit is between 20% and 50% of the span; AND, (2) data recorder not required; AND, (3) only 2 calibration gases are required; AND, (4) calibration error check not required; AND, (5) allowable sample bias, zero drift, and calibration draft are ±10%. Install a sampling port and a thermometer or other temperature measuring device at each wellhead. [40 CFR 60.756(a)]	Measure the N_2 or O_2 concentration in the LFG, and the temperature of the LFG at each individual well, on a monthly basis. If a well exceeds one of the operating parameters, action shall be initiated to correct the exceedance within 5 calendar days. If correction of the exceedance cannot be achieved within 15 calendar days of the first measurement, the gas collection system shall be expanded to correct the exceedance within 120 days of the initial exceedance. Any attempted corrective measure shall not cause exceedances of other operational or performance standards. [40 CFR 60.756(a); 40 CFR 60.755(a)(5)]

Condition	Applicable Requirement	Description (for clarification purposes only, enforceable as listed under 'applicable requirement')	Monitoring and Analysis Procedure or Test Method	Monitoring, Recordkeeping, and Reporting Requirement
13.10	40 CFR 60.753(d) (Landfill NSPS Subpart WWW)	Operate LFG collection system so that the methane concentration is <500 ppm above background at the surface of the landfill.	Conduct surface testing around the perimeter of the collection area along a pattern that traverses the landfill at 30 meter intervals and where visual observations indicate elevated concentrations of LFG, such as distressed vegetation and cracks or seeps in the cover per the surface monitoring design plan and topographical map of the monitoring route. Instrument specifications and procedures for surface monitoring devices: (1) portable analyzer shall meet the instrument specifications provided in section 3 of RM 21, except that "methane" shall replace all references to VOC; AND, (2) calibration gas shall be methane, diluted to a nominal concentration of 500 ppm in air; AND, (3) instrument evaluation procedures of section 4.4 of RM 21 shall be used; AND, (4) calibration procedures provided in section 4.2 of RM 21 shall be followed immediately before commencing a surface monitoring survey. [40 CFR 60.755(d)] Conduct surface monitoring with a portable monitor meeting the specifications provided. The background concentration shall be determined by moving the probe inlet upwind and downwind outside the boundary of the landfill at a distance of at least 30 meters from the perimeter wells. Surface emission monitoring shall be performed in accordance with section 4.3.1 of RM 21, except that the probe inlet shall be placed within 5 to 10 cm of the ground. Monitoring shall be performed during typical meteorological conditions. [40 CFR 60.755(c)]	Monitor for cover integrity on a monthly basis. Implement cover repairs as necessary. [40 CFR 60.755(c)(5)] Conduct surface monitoring on a quarterly basis. Any reading of ≥500 ppm above background at any location shall be recorded as a monitored exceedance and actions below taken. As long as the specified actions are taken, the exceedance is not a violation of these operational requirements. The location of each monitored exceedance shall be marked and the location recorded. Cover maintenance or adjustments to the vacuum of the adjacent wells to increase the gas collection in the vicinity of each exceedance shall be made and the location shall be re-monitored within 10 calendar days of detecting the exceedance. Any location that initially showed an exceedance but has a methane concentration <500 ppm methane above background at the 10-day re-monitoring, shall be re-monitored 1 month from the initial exceedance. If the 1-month re-monitoring shows a concentration <500 ppm above background, no further monitoring of that location is required until the next quarterly monitoring period. If the re-monitoring of the location shows a second exceedance, additional corrective action shall be taken and the location shall be monitored again within 10 days of the second exceedance. If the re-monitoring shows a third exceedance for the same location, a new well or other collection device shall be installed within 120 calendar days of the initial exceedance, OR an alternative remedy to the exceedance, such as upgrading the blower, header pipes or control device, and a corresponding timeline for installation may be submitted to the Administrator for approval. No further monitoring of that location is required until remedy has been taken. [40 CFR 60.755(c)] Submit monthly report to: ODEQ, Western Region – Salem Office 750 Front Street NE, Suite 120 Salem, OR 97301-1039 Monthly report shall include the location of each exceedance of the 500 ppm methane concentration and the concentration recorded at each location for which an exceedance was recorded in the previous month. [40 CFR 60.757(f)]
13.11	40 CFR 60.753(e) (Landfill NSPS Subpart WWW)	Operate the collection system such that all collected gases are vented to the control system. In the event the LFG collection and control is inoperable, the gas mover system shall be shut down and all valves in the collection and control system contributing to venting of the gas to the atmosphere shall be closed within 1 hour.	None specified.	Records shall be kept of all periods when the LFG collection and control system is inoperable, the gas mover system is shut down, or the valves in the collection and control system are closed.

Condition	Applicable Requirement	Description (for clarification purposes only, enforceable as listed under 'applicable requirement')	Monitoring and Analysis Procedure or Test Method	Monitoring, Recordkeeping, and Reporting Requirement
13.12	40 CFR 60.753(f) (Landfill NSPS Subpart WWW)	Operate the LFG control and treatment system at all times when the collected gas is routed to the system.	None specified.	No additional monitoring required.
13.13	40 CFR 60.755(e) (Landfill NSPS Subpart WWW)	The provisions of the NSPS apply at all times, except during periods of start-up, shutdown, or malfunction, provided that the duration of start-up, shutdown, or malfunction shall not exceed 5 days for collection systems.	None specified.	No additional monitoring required.
13.14	40 CFR 60.757(a)(3); 40 CFR 60.4(a) (Landfill NSPS Subpart WWW)	An amended design capacity report shall be submitted to the Department providing notification of any increase in the design capacity of the landfill.	None specified.	If triggered, the permittee shall submit an amended design capacity report to: ODEQ, Western Region – Salem Office 750 Front Street NE, Suite 120 Salem, OR 97301-1039 [40 CFR 60.4(a)]
13.15	40 CFR 60.758(a) (Landfill NSPS Subpart WWW)	Keep, for at least 5 years, up-to-date, readily accessible, on-site records of: (1) the maximum design capacity; AND, (2) the current amount of solid waste in-place; AND, (3) the year-by-year waste acceptance rate. Off-site records may be maintained if they are retrievable within 4 hours. Either paper copy or electronic formats are acceptable.	None specified.	No additional monitoring required.
13.16	40 CFR 60.758(b) (Landfill NSPS Subpart WWW)	Keep up-to-date, readily accessible records for the life of the control equipment of the following data, as measured during the initial performance test or compliance determination: (1) maximum expected gas generation flow rate as calculated in condition 15.5, AND, (2) the density of wells, horizontal collectors, surface collectors, or other gas extraction devices; And, (3) the average combustion temperature measured at least every 15 minutes and averaged over the same time period of the performance test; AND, (4) the percent reduction of NMOC determined as specified in conditions 16 and 17. Records of subsequent tests or monitoring shall be maintained for a minimum of 5 years. Records of the control device vendor specifications shall be maintained until removed.	None specified.	No additional monitoring required.
13.17	40 CFR 60.758(c) (Landfill NSPS Subpart WWW)	Keep for 5 years, up-to-date, readily accessible continuous records of the equipment operating parameters specified to be monitored in the NSPS as well as up-to-date, readily accessible records for periods of operation during which the parameter boundaries established during the most recent performance test are exceeded.	None specified.	No additional monitoring required.

Condition	Applicable Requirement	Description (for clarification purposes only, enforceable as listed under 'applicable requirement')	Monitoring and Analysis Procedure or Test Method	Monitoring, Recordkeeping, and Reporting Requirement
13.20	40 CFR 61.154(e) (Asbestos NESHAP Subpart M)	Maintain waste shipment records for all asbestos-containing waste material received.	None specified.	Waste shipment records shall include: (1) name, address, and telephone number of the waste generator; AND, (2) name, address, and telephone number of the transporter(s); AND, (3) volume of waste; AND, (4) presence of improperly enclosed (leak-tight containers) or uncovered; AND, (5) date of waste receipt. Send a copy of the signed waste shipment record to the waste generator within 30 days of receipt of the waste. If significant amount of improperly enclosed or uncovered waste, report in writing (with copy of waste shipment record) to the Department for the waste generator (as indicated in the waste shipment record), ODEQ, Western Region – Salem Office 750 Front Street NE, Suite 120 Salem, OR 97301-1039 by the following working day. Submit reports (with copy of waste shipment record) of unreconciled waste quantity discrepancies within 15 days of waste receipt to ODEQ, at the address listed above. [40 CFR 61.154(e)(1), (2)]
13.21	40 CFR 61.154(f) (Asbestos NESHAP Subpart M)	Maintain, until closure, records of the location, depth and area, and quantity in cubic meters (cubic yards) of asbestos-containing waste material within the disposal area on a map or diagram of the disposal area.	None specified.	No additional monitoring required.
13.22	40 CFR 61.154(i) (Asbestos NESHAP Subpart M)	Furnish upon request, and make available during normal business hours for inspection by ODEQ, all records required by the Asbestos NESHAP.	None specified.	No additional monitoring required.
13.23	40 CFR 61.154(j) (Asbestos NESHAP Subpart M)	Notify ODEQ in writing at least 45 days prior to excavating or otherwise disturbing any asbestos-containing waste material that has been deposited at the site and is covered.	None specified.	Notification shall include: (1) scheduled starting and completion dates; AND, (2) reason for disturbing waste; AND, (3) emission control procedures to be implemented; AND, (4) location of any temporary storage site and the final disposal site. [40 CFR 61.154(j)]

Condition	Applicable Requirement	Description (for clarification purposes only, enforceable as listed under 'applicable requirement')	Monitoring and Analysis Procedure or Test Method	Monitoring, Recordkeeping, and Reporting Requirement
13.24	40 CFR 60.752(b)(2)(iii)(A) and 40 CFR 60.18 (Landfill NSPS Subpart WWW)	1. Route excess landfill gas not utilized by IC engines to an open flare (Emissions Unit Control) designed and operated in accordance with 40 CFR 60.18. 2. The flare shall be designed for and operated with no visible emissions except for periods not to exceed a total of 5 minutes during any 2 consecutive hours. [40 CFR 60.18(c)(1)] 3. The flare shall be operated with a flame present at all times. [40 CFR 60.18(c)(2)] 4. The flare shall be designed for and operated with an exit velocity less than 60 ft/sec. [40 CFR 60.18(c)(4)(i)] 5. The flare shall be operated at all times when excess landfill gas not utilized by IC engines is being vented to it. [40 CFR 60.18(e)]	Install, calibrate, maintain, and operate according to the manufacturer's specifications the following equipment: (1) a heat sensing device, such as an ultraviolet beam sensor or thermocouple, at the pilot light or the flame itself to indicate the continuous presence of a flame; and (2) a device that records flow to or bypass of the flare. The owner or operator shall either: (i) install, calibrate, and maintain a gas flow measuring device that shall record the flow to the flare at least every 15 minutes; or (ii) secure the bypass line valve in the closed position with a car-seal or a lock-and-key type configuration. [40 CFR 60.756(c)] Reference Method 22 shall be used to determine the compliance with the visible emissions standard. The observation period is 2 hours. [40 CFR 60.18(f)(1)] The net heating value of the gas being combusted in the flare shall be calculated by the equation in 40 CFR 60.18 (f)(3). The actual exit velocity of the flare shall be determined by dividing the volumetric flowrate (in units of standard temperature and pressure) as determined by Reference Methods 2, 2A, 2C,or 2D as appropriate by the unobstructed (free) cross sectional area of the flare tip. [40 CFR 60.18(f)(4)]	Monitoring 1. Operate the heat sensing device or thermocouple. [40 CFR 60.756(c)(1)] 2. Record the gas flow to the flare at least every 15 minutes or visually inspect the seal or closure mechanism at least monthly. [40 CFR 60.756(c)(2)] Recordkeeping 1. Records of the flare vendor specifications until removal of the flare. [40 CFR 60.758(b)] 2. Up-to-date, readily accessible records for the life of the flare of: a. visible emissions readings b. heat content determinations c. flow rate or bypass flow rate measurements d. exit velocity determinations e. continuous records of the flare pilot flame or flare flame monitoring f. all periods of operations during which the pilot flame or the flare flame is absent [40 CFR 60.758(b((4) and (c)(4)]

Condition	Applicable Requirement	Description (for clarification purposes only, enforceable as listed under 'applicable requirement')	Monitoring and Analysis Procedure or Test Method	Monitoring, Recordkeeping, and Reporting Requirement
13.25	40 CFR 63.6(e)(3) (Landfill NESHAP Subpart AAAA)	Develop and implement a written Startup, Shutdown, and Malfunction Plan (SSM Plan) by no later than January 16, 2004.	None specified.	Maintain written SSM Plan on site. If the SSM Plan fails to address, or inadequately addresses, a malfunction, revise the SSM Plan within 45 days after the event to include procedures for operating and maintaining the source during similar malfunctions, and a program of corrective actions for similar malfunctions. [40 CFR 63.6(e)((3)(viii)] Recordkeeping 1. Maintain records for each SSM Plan event which occurs. [40 CFR 63.10(b)(2)(i)] 2. Retain a copy of each previous (superceded) version of the SSM Plan for at least 5 years. [40 CFR 63.6(e)(3)(v)] Reporting 1. Report semiannually all SSM Plan actions that are consistent with the SSM Plan. [40 CFR 63.10(d)(5)(i)] 2. Notify DEQ within 2 days if an SSM event is not consistent with the SSM Plan and follow up with a letter within 7 days of the event. [40 CFR 63.6(e)(3)iv)]

EMISSIONS UNITS PIR AND UPR

Table 4. Summary of requirements for Emissions Units PIR and UPR:

Applicable Requirement	Condition Number	Pollutant/ Parameter	Limit/Standard	Averaging Time	Testing Condition	Monitoring Condition
340-208-0110(2)	14	Visible emissions	20% opacity	3 min. aggregate in 60 minutes	NA	15

14. Applicable Requirement: The permittee must not cause or allow the emissions of any air contaminant into the atmosphere for a period or periods aggregating more than three minutes in any one hour which is equal to or greater than 20% opacity, excluding uncombined water, from emissions units PIR and UPR. [OAR 340-208-0110(2) and 340-208-0110(3)(a)]

15. Monitoring Requirement: At least weekly, the permittee must visually survey the facility using EPA Method 22 for any sources of excess fugitive emissions. For the purpose of this survey, excess fugitive emissions are considered to be any visible emissions that leave the down wind plant site boundaries. The person conducting this survey does not have to be EPA Method 9 certified. However, the individual should be familiar with the procedures of EPA Method 9, including using the proper location to observe visible emissions. If sources of excess fugitive emissions are identified during the survey, the permittee shall perform one of the following:

15.a. immediately take corrective action to minimize the fugitive emissions; or,

15.b. conduct a modified EPA Method 9 test on the device(s) causing the opacity problem within 24 hours.

15.c. Recordkeeping: The permittee must maintain records of all inspections and any corrective action performed.

EMISSIONS UNIT TIP

Table 5. Summary of requirements for Emissions Unit TIP:

Applicable Requirement	Condition Number	Pollutant/ Parameter	Limit/Standard	Averaging Time	Testing Condition	Monitoring Condition
340-208-0110(2)	16	Visible emissions	20% opacity	3 min. aggregate in 60 minutes	NA	20
340-226-0210(1)(b)	17	PM/PM_{10}	0.1 gr/dscf	Avg. of 3 test runs	NA	20

16. Applicable Requirement: The permittee must not cause or allow the emissions of any air contaminant into the atmosphere for a period or periods aggregating more than three minutes in any one hour which is equal to or greater than 20% opacity, excluding uncombined water, from emissions unit TIP. [OAR 340-208-0110(2) and 340-208-0110(3)(a)]

17. Applicable Requirement: The permittee must not cause or allow the emission of particulate matter in excess of 0.1 grain per standard cubic foot from emissions unit TIP. [OAR 340-226-0210(1)(b)]

Insignificant Activities Requirements

18. The Department acknowledges that insignificant emissions units (IEUs) identified by rule as either categorically insignificant activities or aggregate insignificant emissions as defined in OAR 340-200-0020 exist at facilities required to obtain an Oregon Title V Operating Permit. IEUs must comply with all applicable requirements. In general, the requirements that could apply to IEUs are incorporated as follows:

18.a. OAR 340-208-0110 (20% opacity)
18.b. OAR 340-228-0210 (0.1 gr/dscf corrected to 12% CO_2 or 50% excess air for fuel burning equipment)
18.c. OAR 340-226-0210 (0.1 gr/dscf for non-fugitive, non-fuel burning equipment)
18.d. OAR 340-226-0310 (process weight limit for non-fugitive, non-fuel burning process equipment).

Unless otherwise specified in this permit or an applicable requirement, the Department is not requiring any testing, monitoring, recordkeeping, or reporting for the applicable emissions limits and standards that apply to IEUs. However, if testing were performed for compliance purposes, the permittee would be required to use the test methods identified in the definitions of "opacity" and "particulate matter" in OAR 340-208-0010 and perform the testing in accordance with the Department's Source Sampling Manual.

PLANT SITE EMISSION LIMITS

19. Applicable Requirement: The plant site emissions must not exceed the following limits for any 12 consecutive calendar month period: [OAR 340-222-0040 through OAR 340-222-0043]

Pollutant	Plant Site Emission Limit (Tons/yr)
PM	24
PM_{10}	14
CO	99
NO_x	39
SO_2	39
VOC	39
NMOC	49

19.a. The PSEL is based on the actual predicted emissions for the current operating conditions at the facility. A permit modification is required before the PSEL may be increased.

20. Monitoring Requirement: The permittee must determine compliance with the Plant Site Emission Limits established in Condition 19 of this permit by conducting monitoring in accordance with the following procedures, test methods, and frequencies: [OAR 340-218-0050(3)]

20.a. The permittee must monitor and maintain records of the following process parameters:

Table 6. PSEL Monitoring

Emissions Unit(s)	Process Parameter	Units	Measurement Frequency	Measurement Method
F-LFG1	Municipal solid waste in place in Cell 0	Mg or tons	Annually	Records
F-LFG2	Municipal solid waste in place in Cells 1, 2A/2B, 2C/2D, and 3	Mg or tons	Annually	Records
Landfill	Municipal solid waste accepted at landfill	Mg or tons	Annually	Records
F-LFG1 & F-LFG2	Landfill gas generated in each system	$MMft^3$/month, $MMft^3$/yr	Annually using EPA model calculation	Records
F-LFG2	Landfill gas collected and sent to IC engines and % methane	$MMft^3$/month, $MMft^3$/yr	Monthly/Annually	Records
PIR	Number of total vehicles on paved roads	Number	Monthly/Annually	Records
UPR 1	Number of total vehicles on unpaved road 1	Number	Monthly/Annually	Records
UPR 2	Number of commercial vehicles on unpaved road 2	Number	Monthly/Annually	Records
TIP	Number of hours operated	Hours	Monthly/Annually	Records
PCS	Petroleum contaminated soil received	Tons	Monthly/Annually	Records
Open Flare	Landfill gas collected and sent to open flare and % methane	$MMft^3$/month, $MMft^3$/yr	Monthly/Annually	Records

20.b. Emission factors for calculating pollutant emissions:

Table 7. Emission Factors

Emission Units(s)	Pollutant	Emission Factor	Emission Factor Units	Emission Factor Verification Testing	
				Yes/no	Test Method
F-LFG1	CO	10.3	lb/MMft^3 fugitive landfill gas	No	NA
	VOC	51.9	lb/MMft^3 fugitive landfill gas	No	NA
	NMOC	133.2	lb/MMft^3 fugitive landfill gas	No	NA
F-LFG2	CO	10.3	lb/MMft^3 fugitive landfill gas	No	NA
	VOC	51.9	lb/MMft^3 fugitive landfill gas	No	NA
	NMOC	133.2	lb/MMft^3 fugitive landfill gas	No	NA
PIR	PM	0.140	lb/vehicle	No	NA
	PM_{10}	0.027	lb/vehicle	No	NA
UPR 1	PM	0.010	lb/vehicle	No	NA
	PM_{10}	0.004	lb/vehicle	No	NA
UPR 2	PM	0.098	lb/vehicle	No	NA
	PM_{10}	0.021	lb/vehicle	No	NA
Open Flare	PM/PM_{10}	8.5	lb/MMft^3 combusted landfill gas	No	NA
	CO	110.0	lb/MMft^3 combusted landfill gas	No	NA
	NO_x	20.0	lb/MMft^3 combusted landfill gas	No	NA
	SO_2	8.4	lb/MMft^3 combusted landfill gas	No	NA
	VOC	1.16	lb/MMft^3 combusted landfill gas	No	NA
	NMOC	2.71	lb/MMft^3 combusted landfill gas	No	NA
TIP	PM/PM_{10}	0.253	lb/hr	No	NA
	CO	0.768	lb/hr	No	NA
	NO_x	3.57	lb/hr	No	NA
	SO_2	0.236	lb/hr	No	NA
	VOC/ NMOC	0.289	lb/hr	No	NA
PCS	VOC/ NMOC	0.033	lb/ton PCS	No	NA

20.c. For the emissions unit F-LFG1 listed in Table 8, the permittee must determine monthly and 12-month rolling emissions by multiplying the Process Parameter by the emission factor listed above for each pollutant. Calculations must be completed within 30 days of the end of each month.

E = (F-LFG1 generated) * EF *K

where:

E = Emissions, tons
EF = Emission factor, pounds/units
K = conversion constant: 1 ton/2000 lbs

20.d. For the emissions unit F-LFG2 listed in Table 8, the permittee must determine monthly and 12-month rolling emissions by multiplying the Process Parameter by the emission factor listed above for each pollutant. Calculations must be completed within 30 days of the end of each month.

E = (F-LFG2 generated – F-LFG2 collected to IC engines and flare) * EF * K

where:

E = Emissions, tons
EF = Emission factor, pounds/units
K = conversion constant: 1 ton/2000 lbs

20.e. For the emissions unit Open Flare listed in Table 7, the permittee must determine monthly and 12-month rolling emissions by multiplying the Process Parameter by the emission factor listed above for each pollutant. Calculations must be completed within 30 days of the end of each month.

E = (Open flare collected) * EF *K

where:

E = Emissions, tons
EF = Emission factor, pounds/units
K = conversion constant: 1 ton/2000 lbs

20.f. For the emissions units PIR, UPR 1, UPR 2, TIP, and PCS listed in Table 7, the permittee must calculate monthly and 12-month rolling emission by multiplying the Process Parameter by the emission factor listed above for each pollutant. Calculations must be completed within 30 days of the end of each month.

E = MP * EF * K

where:

E = Emissions, tons
MP = Monitored parameter, units/month or units/year
EF = Emission factor, pounds/units
K = conversion constant: 1 ton/2000 lbs

20.g. The emission factors listed in Condition 20.b. are not enforceable limits unless otherwise specified in this permit. Compliance with PSELs must only be determined by the calculations contained in Conditions 20.c. through 20.f of this permit using the measured process parameters recorded during the reporting period and the emission factors contained in Condition 20.b.

21. The permittee must determine compliance with Condition 19 (Plant Site Emission Limits) by summing the emissions calculated in Condition 20 for each emissions unit for each month and each 12-month rolling period, and adding the Aggregate Insignificant emissions of 1 ton per year by pollutant, and comparing the resulting emissions to the Plant Site Emission Limits in Condition 19.

GENERAL TESTING REQUIREMENTS

22. Unless otherwise specified in this permit, the permittee must conduct all testing in accordance with the Department's Source Sampling Manual. [OAR 340-212-0120 and 40 CFR 60.8]

22.a. Unless otherwise specified by a state or federal regulation, the permittee must submit a source test plan to the Department at least 30 days prior to the date of the test. The test plan must be prepared in accordance with the Source Sampling Manual and address any planned variations or alternatives to prescribed test methods. The permittee should be aware that if significant variations are requested, it may require more than 30 days for the Department to grant approval and may require EPA approval in addition to approval by the Department.

22.b. Only regular operating staff may adjust the processes or emission control device parameters during a compliance source test and within two (2) hours prior to the tests. Any operating adjustments made during a compliance source test, which are a result of consultation during the tests with source testing personnel, equipment vendors, or consultants, may render the source test invalid.

22.c. Unless otherwise specified by permit condition or Department approved source test plan, all compliance source tests must be performed as follows:

22.c.i. at least 90% of the design capacity for new or modified equipment;
22.c.ii at least 90% of the maximum operating rate for existing equipment; or
22.c.iii. at 90 to 110% of the normal maximum operating rate for existing equipment. For purposes of this permit, the normal maximum operating rate is defined as the 90th percentile of the average hourly operating rates during a 12 month period immediately preceding the source test. Data supporting the normal maximum operating rate must be included with the source test report.

22.d. Each source test must consist of at least three (3) test runs and the emissions results must be reported as the arithmetic average of all valid test runs. If for reasons beyond the control of the permittee a test run is invalid, the Department may accept two (2) test runs for demonstrating compliance with the emission limit or standard.

22.e. Source test reports prepared in accordance with the Department's Source Sampling Manual must be submitted to the Department within 45 days of completing any required source test, unless a different time period is approved in the source test plan submitted prior to the source test.

GENERAL MONITORING AND RECORDKEEPING REQUIREMENTS

General Monitoring Requirements:

23. The permittee must not knowingly render inaccurate any required monitoring device or method. [OAR 340-218-0050(3)(a)(E)]

24. Methods used to determine actual emissions for fee purposes must also be used for compliance determination and can be no less rigorous than the requirements of OAR 340-218-0080. [OAR 340-218-0050(3)(a)(F)]

25. Monitoring requirements must commence on the date of permit issuance unless otherwise specified in the permit or an applicable requirement. [OAR 340-218-0050(3)(a)(G)]

General Recordkeeping Requirements

26. The permittee must maintain the following general records of testing and monitoring required by this permit: [OAR 340-218-0050(3)(b)(A)]

26.a. the date, place as defined in the permit, and time of sampling or measurements;
26.b. the date(s) analyses were performed;
26.c. the company or entity that performed the analyses;
26.d. the analytical techniques or methods used;
26.e. the results of such analyses;
26.f. the operating conditions as existing at the time of sampling or measurement; and
26.g. the records of quality assurance for continuous monitoring systems (including but not limited to quality control activities, audits, calibration drift checks).

27. Unless otherwise specified by permit condition, the permittee must make every effort to maintain 100 percent of the records required by the permit. If information is not obtained or recorded for legitimate reasons (e.g., the monitor or data acquisition system malfunctions due to a power outage), the missing record(s) will not be considered a permit deviation provided the amount of data lost does not exceed 10% of the averaging periods in a reporting period or 10% of the total operating hours in a reporting period, if no averaging time is specified. Upon discovering that a required record is missing, the permittee must document the reason for the missing record. In addition, any missing record that can be recovered from other available information will not be considered a missing record. [OAR 340-214-0110, 340-212-0160, and 340-218-0050(3)(b)]

28. Recordkeeping requirements must commence on the date of permit issuance unless otherwise specified in the permit or an applicable requirement. [OAR 340-218-0050(3)(b)(C)]

29. Unless otherwise specified, the permittee must retain records of all required monitoring data and support information for a period of at least five (5) years from the date of the monitoring sample, measurement, report, or application. Support information includes all calibration and maintenance records and all original strip-chart recordings (or other original data) for continuous monitoring instrumentation, and copies of all reports required by the permit. All existing records required by the previous Oregon Title V Operating Permit must also be retained for five (5) years from the date of the monitoring sample, measurement, report, or application. [OAR 340-218-0050(b)(B)]

REPORTING REQUIREMENTS

General Reporting Requirements

30. Excess Emissions Reporting The permittee must report all excess emissions as follows: [OAR 340-214-0300 through 340-214-0360]

30.a. Immediately (within 1 hour of the event) notify the Department of an excess emission event by phone, e-mail, or facsimile; and

30.b. Within 15 days of the excess emissions event, submit a written report that contains the following information: [OAR 340-214-0340(1)]

30.b.i. The date and time of the beginning of the excess emissions event and the duration or best estimate of the time until return to normal operation;

30.b.ii. The date and time the owner or operator notified the Department of the event;

30.b.iii. The equipment involved;

30.b.iv. Whether the event occurred during planned startup, planned shutdown, scheduled maintenance, or as a result of a breakdown, malfunction, or emergency;

30.b.v. Steps taken to mitigate emissions and corrective action taken, including whether the approved procedures for a planned startup, shutdown, or maintenance activity were followed;

30.b.vi. The magnitude and duration of each occurrence of excess emissions during the course of an event and the increase over normal rates or concentrations as determined by continuous monitoring or best estimate (supported by operating data and calculations);

30.b.vii. The final resolution of the cause of the excess emissions; and

30.b.viii. Where applicable, evidence supporting any claim that emissions in excess of technology-based limits were due to any emergency pursuant to OAR 340-214-0360.

30.c. In the event of any excess emissions which are of a nature that could endanger public health and occur during non-business hours, weekends, or holidays, the permittee must immediately notify the Department by calling the Oregon Accident Response System (OARS). The current number is 1-800-452-0311.

30.d. If startups, shutdowns, or scheduled maintenance may result in excess emissions, the permittee must submit startup, shutdown, or scheduled maintenance procedures used to minimize excess

emissions to the Department for prior authorization, as required in OAR 340-214-0310 and 340-214-0320. New or modified procedures must be received by the Department in writing at least 72 hours prior to the first occurrence of the excess emission event. The permittee must abide by the approved procedures and have a copy available at all times.

30.e. The permittee must notify the Department of planned startup/shutdown or scheduled maintenance events.

30.f. The permittee must continue to maintain a log of all excess emissions in accordance with OAR 340-214-0340(3). However, the permittee is not required to submit the detailed log with the semi-annual and annual monitoring reports. The permittee is only required to submit a brief summary listing the date, time, and the affected emissions units for each excess emission that occurred during the reporting period. [OAR 340-218-0050(3)(c)]

31. Permit Deviations Reporting: The permittee must promptly report deviations from permit requirements that do not cause excess emissions, including those attributable to upset conditions, as defined in the permit, the probable cause of such deviations, and any corrective actions or preventive measures taken. "Prompt" means within 15 days of the deviation. Deviations that cause excess emissions, as specified in OAR 340-214-0300 through 340-214-0360 must be reported in accordance with Condition 23.

32. All required reports must be certified by a responsible official consistent with OAR 340-218-0040(5);[OAR 340-218-0050(3)(c)(D)]

33. Reporting requirements must commence on the date of permit issuance unless otherwise specified in the permit. [OAR 340-218-0050(3)(c)(E)]

Addresses of regulatory agencies are the following, unless otherwise instructed:

DEQ – Western Region
750 Front Street NE, Suite 120

US Environmental Protection Agency
Mail Stop OAQ-108
1200 Sixth Avenue
Seattle, WA 98101

Semi-annual and Annual Reports

34. The permittee must submit three (3) copies of reports of any required mon ring at least every 6 months, completed on forms approved by the Department. Six month periods are uary 1 to June 30, and July 1 to December 31. One copy of the report must be submitted to the EPA a two copies to the DEQ regional office. All instances of deviations from permit requirements must be cl rly identified in such reports: [OAR 340-218-0050(3)(c)(A) and 340-218-0080(6)(d)]]

34.a. The first semi-annual report is be due on July 30 and must include the semi-annual compliance certification, OAR 340-218-0080.

34.b. The annual report is due on February 15 and must consist of the following:

34.b.i. the emission fee report; [OAR 340-220-0100]
34.b.ii. a summary of the excess emissions upset log; [OAR 340-214-0340]
34.b.iii. the second semi-annual compliance certification; [OAR 340-218-0080]
34.b.iv. the annual emission inventory report for the prior calendar year;
34.b.v. greenhouse gas emissions in accordance with Division 215 of OAR Chapter 340. [OAR 340-215-0040(3)(a)]

35. The semi-annual compliance certification must include the following (provided that the identification of applicable information may cross-reference the permit or previous reports, as applicable): [OAR 340-218-0080(6)(c)]

35.a. The identification of each term or condition of the permit that is the basis of the certification;

35.b. The identification of the method(s) or other means used by the owner or operator for determining the compliance status with each term and condition during the certification period, and whether such methods or other means provide continuous or intermittent data. Such methods and other means must include, at a minimum, the methods and means required under OAR 340-218-0050(3). *Note: Certification of compliance with the monitoring conditions in the permit is sufficient to meet this requirement, except when the permittee must certify compliance with new applicable requirements that are incorporated by reference into the permit. When certifying compliance with new applicable requirements that are not yet in the permit, the permittee must provide the information required by this condition.* If necessary, the owner or operator also must identify any other material information that must be included in the certification to comply with section 113(c)(2) of the FCAA, which prohibits knowingly making a false certification or omitting material information;

35.c. The status of compliance with terms and conditions of the permit for the period covered by the certification, including whether compliance during the period was continuous or intermittent. The certification must be based on the method or means designated in OAR 340-218-0040(6)(c)(B). The certification must identify each deviation and take it into account in the compliance certification. The certification must also identify as possible exceptions to compliance any periods during which compliance is required and in which an excursion or exceedance, as defined under OAR 340-200-0020, occurred; and

35.d. Such other facts as the Department may require to determine the compliance status of the source.

36. Notwithstanding any other provision contained in any applicable requirement, the owner or operator may use monitoring as required under OAR 340-218-0050(3) and incorporated into the permit, in addition to any specified compliance methods, for the purpose of submitting compliance certifications. [OAR 340-218-0080(6)(e)]

Monthly Reports

37. The permittee must report the following information for the preceding month within 30 days of the end of each calendar month to the Western Region-Salem office of the Department:

37.a. The cover integrity monitoring results and repairs, if necessary, as required by Condition 13.10;

37.b. The results of the quarterly surface methane monitoring, if conducted during the month, and corrective actions taken as required by Condition 13.10;

37.c. Any other information regarding upsets, maintenance required, or operational problems encountered during the month on the landfill gas collection or control systems;

37.d. Information concerning the installation date and location of any newly installed wells or expansion of the landfill gas collection system as required by Condition 13.7;

37.e. The amount of landfill gas collected and treated in both the IC engines and the flare;

37.f. The total operating hours of the IC engines and flare during the month; and,

37.g. Log of air quality complaints received during the month under Condition 8.

EMISSION FEES

38. Emission fees will be based on the Plant Site Emission Limits in Condition 19, unless the permittee elects to report actual emissions for one or more permitted processes/pollutants using the procedures in OAR 340 Division 220. If the permittee reports actual emissions for one or more permitted processes/pollutants, the permitted emissions for the remaining permitted processes/pollutants will be based on the following table: [OAR 340-220-0090]

Emission Source Description	Permitted Process Code (DEQ Codes)	PM_{10} (tons)	SO_2 (tons)	NO_x (tons)	VOC (tons
Roads	FS-1	3.1			
Open Flare	GS-1	2.2	2.2	5.2	0.3
Fugitive LFG	FS-2				11.0
Petroleum Cont. Soil	FS-2				0.8
Tipper	GS-1	0.3	0.2	3.6	0.3
AI	GS-1	1.0	1.0	1.0	1.0

NON-APPLICABLE REQUIREMENTS

39. State and Federal air quality requirements (e.g., rules and regulations) currently determined not applicable to the permittee are listed below along with the reason for the non-applicability: [OAR 340-218-0110]

Reason code definitions:

A this pollutant is not emitted by the facility
B the facility is not in this source category
C the facility is not in a special control/nonattainment area
D the facility is not in this county
E the facility does not have this emissions unit
F the facility does not use this fuel type

G the rule does not apply because no changes have been made at the facility that would trigger these procedural requirements
H this method/procedure is not used by the facility
I this rule applies only to DEQ and regional authorities
J there are no emissions units with add-on control devices or the pre-controlled potential emissions are less than 100 tons per year or the emissions units with add-on control devices and pre-controlled emissions greater than 100 tons per year are subject to emissions standards promulgated after November of 1990

GENERAL CONDITIONS

G1. General Provision

Terms not otherwise defined in this permit have the meaning assigned to such terms in the referenced regulation.

G2. Reference materials

Where referenced in this permit, the versions of the following materials are effective as of the dates noted unless otherwise specified in this permit:

a. Source Sampling Manual; January 23, 1992 - State Implementation Plan Volume 3, Appendix A4;
b. Continuous Monitoring Manual; January 23, 1992 - State Implementation Plan Volume 3, Appendix A6; and
c. All state and federal regulations as in effect on the date of issuance of this permit.

G3. Applicable Requirements [OAR 340-218-0010(3)(b)]

Oregon Title V Operating Permits do not replace requirements in Air Contaminant Discharge Permits (ACDP) issued to the source even if the ACDP(s) have expired. For a source operating under a Title V permit, requirements established in an earlier ACDP remain in effect notwithstanding expiration of the ACDP or Title V permit, unless a provision expires by its terms or unless a provision is modified or terminated following the procedures used to establish the requirement initially. Source specific requirements, including, but not limited to TACT, RACT, BACT, and LAER requirements, established in an ACDP must be incorporated into the Oregon Title V Operating Permit and any revisions to those requirements must follow the procedures used to establish the requirement initially.

G4. Compliance [OAR 340-218-0040(3)(n)(C), 340-218-0050(6), and 340-218-0080(4)]

a. The permittee must comply with all conditions of this permit. Any permit condition noncompliance constitutes a violation of the Federal Clean Air Act and/or state rules and is grounds for enforcement action; for permit termination, revocation and re-issuance, or modification; or for denial of a permit renewal application. Any noncompliance with a permit condition specifically designated as enforceable only by the state constitutes a violation of state rules only and is grounds for enforcement action; for permit termination, revocation and re-issuance, or modification; or for denial of a permit renewal application.
b. Any schedule of compliance for applicable requirements with which the source is not in compliance at the time of permit issuance is supplemental to, and does not sanction noncompliance with the applicable requirements on which it is based.
c. For applicable requirements that will become effective during the permit term, the source must meet such requirements on a timely basis unless a more detailed schedule is expressly required by the applicable requirement.

G5. Masking Emissions:

The permittee must not install or use any device or other means designed to mask the emission of an air contaminant that causes or is likely to cause detriment to health, safety, or welfare of any person or otherwise violate any other regulation or requirement. [OAR 340-208-0400] This condition is enforceable only by the State.

G6. Credible Evidence:

Notwithstanding any other provisions contained in any applicable requirement, any credible evidence may be used for the purpose of establishing whether a person has violated or is in violation of any such applicable requirements. [OAR 340-214-0120]

G7. Certification [OAR 340-214-0110, 340-218-0040(5), 340-218-0050(3)(c)(D), and 340-218-0080(2)]

Any document submitted to the Department or EPA pursuant to this permit must contain certification by a responsible official of truth, accuracy and completeness. All certifications must state that based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and, complete. The permittee must promptly, upon discovery, report to the Department a material error or omission in these records, reports, plans, or other documents.

G8. Open Burning [OAR Chapter 340, Division 264]

The permittee is prohibited from conducting open burning, except as may be allowed by OAR 340-264-0020 through 340-264-0200.

G9. Asbestos [40 CFR Part 61, Subpart M (federally enforceable), OAR Chapter 340-248-0005 through 340-248-0180 (state-only enforceable) and 340-248-0205 through 340-248-0280]

The permittee must comply with OAR Chapter 340, Division 248, and 40 CFR Part 61, Subpart M when conducting any renovation or demolition activities at the facility.

G10. Stratospheric Ozone and Climate Protection [40 CFR 82 Subpart F, OAR 340-260-0040]

The permittee must comply with the standards for recycling and emissions reduction pursuant to 40 CFR Part 82, Subpart F, Recycling and Emissions Reduction.

G11. Permit Shield [OAR 340-218-0110]

a. Compliance with the conditions of the permit is deemed compliance with any applicable requirements as of the date of permit issuance provided that:

   i. such applicable requirements are included and are specifically identified in the permit, or
   ii. the Department, in acting on the permit application or revision, determines in writing that other requirements specifically identified are not applicable to the source, and the permit includes the determination or a concise summary thereof.

b. Nothing in this rule or in any federal operating permit alters or affects the following:

   i. the provisions of ORS 468.115 (enforcement in cases of emergency) and ORS 468.035 (function of department);
   ii. the liability of an owner or operator of a source for any violation of applicable requirements prior to or at the time of permit issuance;

iii. the applicable requirements of the national acid rain program, consistent with section 408(a) of the FCAA; or
iv. the ability of the Department to obtain information from a source pursuant to ORS 468.095 (investigatory authority, entry on premises, status of records).

c. Sources are not shielded from applicable requirements that are enacted during the permit term, unless such applicable requirements are incorporated into the permit by administrative amendment, as provided in OAR 340-218-0150(1)(h), significant permit modification, or reopening for cause by the Department.

G12. Inspection and Entry [OAR 340-218-0080(3)]

Upon presentation of credentials and other documents as may be required by law, the permittee must allow the Department of Environmental Quality, or an authorized representative (including an authorized contractor acting as a representative of the EPA Administrator), to perform the following:

a. enter upon the permittee's premises where an Oregon Title V Operating Permit program source is located or emissions-related activity is conducted, or where records must be kept under the conditions of the permit;
b. have access to and copy, at reasonable times, any records that must be kept under conditions of the permit;
c. inspect, at reasonable times, any facilities, equipment (including monitoring and air pollution control equipment), practices, or operations regulated or required under the permit; and
d. as authorized by the FCAA or state rules, sample or monitor, at reasonable times, substances or parameters, for the purposes of assuring compliance with the permit or applicable requirements.

G13. Fee Payment [OAR 340-220-0010, and 340-220-0030 through 340-220-0190]

The permittee must pay an annual base fee and an annual emission fee for particulates, sulfur dioxide, nitrogen oxides, and volatile organic compounds. The permittee must submit payment to the Department of Environmental Quality, Business Office, 811 SW 6th Avenue, Portland, OR 97204, within 30 days of the date the Department mails the fee invoice or August 1 of the year following the calendar year for which emission fees are paid, whichever is later. Disputes must be submitted in writing to the Department of Environmental Quality. Payment must be made regardless of the dispute. User-based fees will be charged for specific activities (e.g., computer modeling review, ambient monitoring review, etc.) requested by the permittee.

G14. Off-Permit Changes to the Source [OAR 340-218-0140(2)]

a. The permittee must monitor for, and record, any off-permit change to the source that:

i. is not addressed or prohibited by the permit;
ii. is not a Title I modification;
iii. is not subject to any requirements under Title IV of the FCAA;
iv. meets all applicable requirements;
v. does not violate any existing permit term or condition; and
vi. may result in emissions of regulated air pollutants subject to an applicable requirement but not otherwise regulated under this permit or may result in insignificant changes as defined in OAR 340-200-0020.

b. A contemporaneous notification, if required under OAR 340-218-0140(2)(b), must be submitted to the Department and the EPA.

c. The permittee must keep a record describing off-permit changes made at the facility that result in emissions of a regulated air pollutant subject to an applicable requirement, but not otherwise regulated under the permit, and the emissions resulting from those off-permit changes.
d. The permit shield of Condition G9 does not extend to off-permit changes.

G15. Section 502(b)(10) Changes to the Source [OAR 340-218-0140(3)]

a. The permittee must monitor for, and record, any section 502(b)(10) change to the source, which is defined as a change that would contravene an express permit term but would not:

i. violate an applicable requirement;
ii. contravene a federally enforceable permit term or condition that is a monitoring, recordkeeping, reporting, or compliance certification requirement; or
iii. be a Title I modification.

b. A minimum 7-day advance notification must be submitted to the Department and the EPA in accordance with OAR 340-218-0140(3)(b).
c. The permit shield of Condition G9 does not extend to section 502(b)(10) changes.

G16. Administrative Amendment [OAR 340-218-0150]

Administrative amendments to this permit must be requested and granted in accordance with OAR 340-218-0150. The permittee must promptly submit an application for the following types of administrative amendments upon becoming aware of the need for one, but no later than 60 days of such event:

a. legal change of the registered name of the company with the Corporations Division of the State of Oregon, or
b. sale or exchange of the activity or facility.

G17. Minor Permit Modification [OAR 340-218-0170]

The permittee must submit an application for a minor permit modification in accordance with OAR 340-218-0170.

G18. Significant Permit Modification [OAR 340-218-0180]

The permittee must submit an application for a significant permit modification in accordance with OAR 340-218-0180

G19. Staying Permit Conditions [OAR 340-218-0050(6)(c)]

Notwithstanding conditions G16 and G17, the filing of a request by the permittee for a permit modification, revocation and re-issuance, or termination, or of a notification of planned changes or anticipated noncompliance does not stay any permit condition.

G20. Construction/Operation Modification [OAR 340-218-0190]

The permittee must obtain approval from the Department prior to construction or modification of any stationary source or air pollution control equipment in accordance with OAR 340-210-0200 through OAR 340-210-0250.

G21. New Source Review Modification [OAR 340-224-0010]

The permittee may not begin construction of a major source or a major modification of any stationary source without having received an air contaminant discharge permit (ACDP) from the Department and having satisfied the requirements of OAR 340, Division 224.

G22. Need to Halt or Reduce Activity Not a Defense [OAR 340-218-0050(6)(b)]

The need to halt or reduce activity will not be a defense. It will not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

G23. Duty to Provide Information [OAR 340-218-0050(6)(e) and OAR 340-214-0110]

The permittee must furnish to the Department, within a reasonable time, any information that the Department may request in writing to determine whether cause exists for modifying, revoking and reissuing, or terminating the permit, or to determine compliance with the permit. Upon request, the permittee must also furnish to the Department copies of records required to be retained by the permit or, for information claimed to be confidential, the permittee may furnish such records to the Department along with a claim of confidentiality.

G24. Reopening for Cause [OAR 340-218-0050(6)(c) and 340-218-0200]

a. The permit may be modified, revoked, reopened and reissued, or terminated for cause as determined by the Department.
b. A permit must be reopened and revised under any of the circumstances listed in OAR 340-218-0200(1)(a).
c. Proceedings to reopen and reissue a permit must follow the same procedures as apply to initial permit issuance and affect only those parts of the permit for which cause to reopen exists.

G25. Severability Clause [OAR 340-218-0050(5)]

Upon any administrative or judicial challenge, all the emission limits, specific and general conditions, monitoring, recordkeeping, and reporting requirements of this permit, except those being challenged, remain valid and must be complied with.

G26. Permit Renewal and Expiration [OAR 340-218-0040(1)(a)(D) and 340-218-0130]

a. This permit expires at the end of its term, unless a timely and complete renewal application is submitted as described below. Permit expiration terminates the permittee's right to operate.
b. Applications for renewal must be submitted at least 12 months before the expiration of this permit, unless the Department requests an earlier submittal. If more than 12 months is required to process a permit renewal application, the Department must provide no less than six (6) months for the owner or operator to prepare an application.
c. Provided the permittee submits a timely and complete renewal application, this permit will remain in effect until final action has been taken on the renewal application to issue or deny the permit.

G27. Permit Transference [OAR 340-218-0150(1)(d)]

The permit is not transferable to any person except as provided in OAR 340-218-0150(1)(d).

G28. Property Rights [OAR 340-200-0020 and 340-218-0050(6)(d)]

The permit does not convey any property rights in either real or personal property, or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor any infringement of federal, state, or local laws or regulations, except as provided in OAR 340-218-0110.

G29. Permit Availability [OAR 340-200-0020 and 340-218-0120(2)]

The permittee must have available at the facility at all times a copy of the Oregon Title V Operating Permit and must provide a copy of the permit to the Department or an authorized representative upon request.

1 Introduction

1.1 Purpose

The purpose of this document is to provide a design plan in accordance with the Oregon State Plan design requirements for the landfill gas (LFG) collection and control system (GCCS) at the Coffin Butte Landfill (CBLF). This document serves as the GCCS Design Plan and was prepared pursuant to OAR 340-239-0110. This GCCS Design Plan supersedes all other previously prepared GCCS Design Plan Submittals.

1.2 Compliance Summary

A summary of applicable regulations and implementation of these regulations at Coffin Butte Landfill is presented in Appendix H of this Design Plan.

1.3 Certification

This Design Plan for the GCCS at CBLF has been prepared by Energyneering Solutions (ESI), as authorized by Republic, which operates the GCCS at CBLF.

I certify that the GCCS as described in this plan meets the design requirements specified in OAR 340-239-0110. I further certify that this Design Plan was prepared by me or under my direct supervision, and that I am a duly registered Professional Engineer.

Benjamin Benson, P.E.

Certifying Engineer

Oregon P.E. License No. 80443

2 Existing Site Conditions

2.1 Landfill Description

Coffin Butte Landfill is located in Corvallis, in Benton County, Oregon. The landfill is owned and operated by Republic under Solid Waste Permit Identification Number 306 issued by the Oregon Department of Environmental Quality (DEQ). The landfill accepts municipal solid waste (MSW), construction and demolition landfill waste (CDL), and inert burn waste. The landfill began accepting waste in 1978 and has a design capacity of approximately 39.7 million tons at a projected closure date of 2041.

2.2 Current GCCS

An active GCCS is in place and operating and will be expanded as waste continues to be placed. As of 2021, CBLF has 312 active vertical extraction wells and horizontal collectors in total. Existing vertical extraction wells have a well spacing ranging from 150 to 200 feet throughout the fill area. Whenever possible, existing wells were installed along permanent benches and at edges of plateaus. These locations made them easier to maintain, monitor, and install; additionally, this ensured the wells stayed out of the way of site filling operations. In other cases, some vertical wells and horizontal collectors were extended, replaced, or decommissioned as needed according to operation and compliance needs.

The elevation difference between ground surface and the operational layer at all wellhead locations is at a minimum 55ft (i.e. wells were not be drilled in waste less than 55ft deep), and there is a minimum of 15ft between the bottom of each well and the operational layer to ensure the liner is protected. All other vertical wells are drilled to their maximum depth to facilitate liquid collection and drainage to the base of the landfill. Where gravel chimneys or gabion baskets have been installed at the base of a cell, vertical wells are drilled to the top of the chimneys to encourage liquid drainage and collection. Borehole drilling locations were specified with coordinates by the Engineer in detailed designs. The selected drilling Contractor sent surveyed and staked well locations to the Engineer prior to drilling so that waste depths could be verified

Permanent lateral and header pipes were installed below grade and were constructed of high-density polyethylene (HDPE) pipe. Temporary piping was installed either above or below grade to accommodate ongoing waste placement operations as needed. LFG is currently conveyed through this pipe network to the electrical generation plant and backup utility flares, located southeast of the disposal area.

Condensate that forms in the GCCS piping is discharged to the leachate collection system (LCS) via direct connections to LCS clean/access riser or to condensate pump stations located around the perimeter of the disposal area. Condensate drained by gravity to the condensate pump stations is discharged through a force main(s) to the LCS. Condensate collected in condensate drains is transported via gravity directly to the LCS via leachate system access risers. The condensate is disposed of coincidentally with landfill leachate in accordance with the requirements of the facility Solid Waste Permit.

Additional information and drawings of the GCCS are included in Appendix A.

2.3 Control System

Currently, the landfill directs its LFG to an electrical generation plant owned and operated by the Pacific Northwest Generating Cooperative (PNGC) which consists of three 3516 Caterpillar engines each capable combusting of approximately 287 scfm and two 3520 Caterpillar engines each capable of combusting approximately 527 scfm each and has the ability for further expansion.

The PNGC facility has two backup utility flares for handling excess LFG. The blower skid and flare system equipment are located on the southeastern corner of the landfill. The complete system includes two LFG blowers and two candlestick flares with a combined 3,000 scfm capacity. One 2000 scfm capacity flare was installed with the initial GCCS, while an additional 1000 scfm flare was installed in 2015 after the LFG flow to the flare station rose following GCCS expansion. As of 2021, the flare station currently has a combined flow approximately 2000-2200 scfm with the remainder of the collected LFG being utilizes by the power generation facility that has up to 95% annual generation capacity.

The flares are designed to reduce NMOCs by 98 percent weight or reduce the outlet NMOC concentration to less than 20 parts per million by volume, dry basis as hexane at 3 percent oxygen, which meets 40 CFR §60.752(b)(2)(iii)(B), but not OAR 340-239-0110 (2)(b)(A) which requires a methane destruction efficiency of at least 99 percent by weight. Both current flares are equipped with continuous temperature recorders and flowmeters which meet the requirements of OAR 340-239-0110 (2)(c)(A)(i) and OAR 340-239-0110 (2)(c)(A)(ii).

In accordance with OAR 340-239-0110 (2)(c)(A)(ii)(I) the flare exhaust temperatures and LFG flow rate are monitored continuously. The flare exhaust temperature is monitored using a thermocouple installed at the flare tip. The LFG flow rate is measured using an orifice plate, installed along the LFG piping, downstream of the blowers. The utility flare is constantly monitored for the presence of a flame, indicating that combustion is occurring. Monitoring for the presence of a flame is accomplished by an ultraviolet flame scanner, thermocouple, or comparable device. In the event that a flame is not detected, indicating that the combustion process has been disrupted, the monitoring system will automatically:

- Cut power to the LFG blowers, and;

- Initiate the closure of a pneumatic-activated valve at the inlet to the blowers. There is no bypass around the control device.

Stopping the blowers will cause the LFG extraction process to cease. Closing the inlet valve to the blowers will eliminate the potential for direct venting of LFG through the control device system.

The backup utility flare consists of a 2,000 scfm capacity skid mounted utility flare system manufactured by LFG & E International in order to provide additional LFG control capacity. The utility Triton flare, model CF-2000, is 10-inch diameter and approximately 31-feet tall. The skid-mounted utility flare system also features a fail-closed valve, a main condensate knockout, a flow meter, a 2,000 scfm capacity New York blower, and a control valve for the blower. The blower is a single stage fan blower with direct drive 30 HP, 480 V AC, three phase motor, and shall be capable of generating 50 inches water column (W.C.) inlet vacuum and 15 inches W.C. discharge pressure.

In the event that LFG extracted from the landfill exceeds the capacity of the control systems, additional control mechanisms will be installed. These additional control mechanisms may include, but are not limited to, upgrading the existing control devices or installation of other beneficial-use facilities.

Visual inspections of all control mechanisms associated with the control system are performed monthly.

3 FUTURE GCCS

The Coffin Butte Landfill will continue to place waste in accordance with the solid waste permit. Installation of additional GCCS components is anticipated to be coordinated with fill development and as required by DEQ regulations regarding installation of GCCS components stipulated in OAR 340-239-0110: Gas Collection and Control System Requirements. Due to operational changes, the GCCS design plan presented in Appendix A may be altered to maintain compliance with the provisions of the DEQ and to accommodate actual field conditions at the time of construction.

3.1 VERTICAL WELLS

Vertical wells will be constructed of 6" diameter schedule 40 carbon steel or HDPE piping. Perforations of vertical wells will be at a suitable depth to prevent air intrusion, as calculated in Section 5.3. The borehole for vertical wells will be a minimum of 3ft in diameter with washed non-calcareous stone fill made up of stone from 1-3 inches in size. The borehole will have bentonite plug between the stone backfill and soil cover, as well as a secondary bentonite plug within the soil cover, to prevent migration of gas through the borehole. Where the wellhead comes above the landfill's cover tarping, a geomembrane boot will be installed. Vertical well material, size, connections, and backfill may be modified; however, vertical wells will maintain compliance to OAR 340-239-0110(1) and OAR 340-239-0110(2).

The elevation difference between ground surface and the operational layer at all wellhead locations will at a minimum be 55ft (i.e. wells will not be drilled in waste less than 55ft deep), and there will be a minimum of 15ft between the bottom of each well and the operational layer to ensure the liner is protected. All vertical wells will be drilled to their maximum depth, within the bounds described previously, to facilitate liquid collection and drainage to the base of the landfill. Where gravel chimneys or gabion baskets have been installed at the base of a cell, vertical wells will be drilled to the top of the chimneys to encourage liquid drainage and collection. Borehole drilling locations will be specified with coordinates by the Engineer in detailed designs. The selected drilling Contractor will send surveyed and staked well locations to the Engineer prior to drilling so that waste depths can be verified.

To maximize vertical well life, wells will only be drilled in areas of final, or interim final fill. Wells installed in interim final fill areas are designed to maximize collection from an area that will remain undisturbed for many years and will only be placed in areas with adequate waste depth. Eventually, as filling in these areas resumes, the wells will need extended or replaced to continue providing adequate collection.

Whenever possible, wells will be installed along permanent benches and at edges of plateaus. These locations will make them easier to maintain, monitor, and install; additionally, this will ensure the wells stay out of the way of site filling operations. Vertical wells will be spaced to ensure adequate LFG collection density in accordance with OAR 340-239-0110(1)(c)(J); spacing determination is further described in Section 5.3.

ESI is currently evaluating performance of carbon steel vertical well casing which have been installed over the previous few years. An adaptive design process should consider long term performance of all casing materials installed at this site to ensure the materials used provide the highest probability of long-term success.

Minimal corrosion of the carbon steel casings have been observed to date and no steel casings have collapsed under the forces of waste settlement. As a tentative plan, it is intended to continue installing carbon steel casings when installation is along a permanent side slope. The top 3 feet of these steel casings is to be an extension of SDR 11 HDPE to allow for wellhead lowering as necessary based on settlement. When vertical extraction wells are planned for installation on an intermediate slope, casing material should be reviewed on a case-by-case basis to determine if the cost of carbon steel casings is justified based on the anticipated life span for the installed location.

A typical vertical extraction well detail is shown on drawing sheet M3.01 in Appendix A. Carbon steel and PVC casings are to be slotted per Detail C shown on drawing sheet M3.08. HDPE casings, if used, are to be perforated per Detail D on the same drawing sheet. Carbon steel casings will be evaluated to see how the material performs for 10 or more years of use.

3.2 Horizontal Collectors

Horizontal collectors will be constructed of 6" diameter HDPE DR11. Collectors will be centered within a trench, a minimum of 2ft wide and 3ft deep, backfilled with washed non-calcareous stone (1-3 inches in size). A bentonite plug will be installed at the transition from solid to perforated pipe and a geomembrane boot provided where the pipe comes above the landfill cover tarping. Whenever possible, horizontal collectors will be designed to drain liquid back into the landfill, rather than out through wellheads. Like the vertical well design, horizontal collector design is subject to modification but will maintain compliance to OAR 340-239-0110(1) and OAR 340-239-0110(2).

As has been done previously in the existing GCCS, horizontal collectors will be used between waste lifts and in shallower areas of fill. These collectors will have a minimum 100 ft distance from perforated pipe to the edge of fill and will be spaced at 100ft from each other. They will typically not be collected from until there is at least 30ft of waste placed above them or otherwise sufficient LFG generation. Horizontal collectors will act as surface collectors if necessary, and the GCCS may be expanded by adding horizontal collectors near the perimeter of waste to prevent offsite migration as per OAR 340-239-0110(1)(c)(J). By following these guidelines for horizontal collectors, air intrusion will be prevented, and anaerobic decomposition promoted. Horizontal collectors are not shown on the master plan layout for clarity.

3.3 LFG Piping

All lateral and header LFG piping will be butt fusion welded HDPE at a minimum thickness of SDR 17. Piping will be sized, as specified in Section 5.4, to maintain a adequate vacuum of at each wellhead, even during maximum expected LFG generation; the current blowers will be required to run at their full capacity, 50" W.C., to do this. As discussed in Sections 4.8 and 4.9 HDPE header and lateral piping will be suitably resistant to corrosion and to decomposition due to heat meeting requirement OAR 340-239-0110(2)(a)(I). The LFG piping will be installed in a manner that minimizes obstruction of filling operations as discussed in Section 4.6. Header and lateral piping will be in regions that have reached final fill unless the piping is specified as temporary in designs. When piping is temporary or in specific cases outlined in GCCS designs, it may be necessary to install piping above grade; however, the majority of LFG piping will be installed in a trench as discussed in Section 3.3.1.

3.3.1 Trenching and Slope

According to the US Army Corps of Engineer's *Landfill Gas Collection and Treatment Systems Engineer Manual*, when header pipe is within the Landfill boundaries, it should be on a 2% grade when condensate flow is in the same direction as LFG flow and a 4% grade when condensate flows opposite to LFG. This grade prevents differential settlement in the Landfill from causing low spots in the header piping. Considering this recommendation and ESI's experience, a 3% grade was selected for header and lateral piping at the Landfill to allow condensate drainage to the appropriate in-line condensate sumps located at low points and other strategic locations throughout the Landfill. A survey of the LFG piping path will be submitted to the Engineer during all construction projects by the Contractor so elevation and location can be verified.

Header and lateral piping will be buried with two strips of warning tape buried 3-6" above it; piping will be spaced 6" from any other pipes if it is in a shared trench. Pipe trenches will be backfilled with sand bedding that will support the pipe in resisting vertical loads. Each pipe will be buried at a minimum of 1 ft from pipe crown to the surface except where the LFG header crosses a bench in the landfill, in final closure areas, or when an above ground stub-up is specified in design drawings.

3.4 Wellheads

Vertical wells and horizontal collectors will each have a wellhead comprised of, at minimum, a positive closing throttle valve and at least two sampling ports, as specified in OAR 340-239-0110(2)(a)(K). As feasible, new wellheads will be installed, and existing wellheads retrofitted, with flow meter devices and separate temperature sampling ports to ensure accurate flow readings. Standard wellhead pipe sizing will be 2"; wellhead sizing may be increased or decreased to accommodate unique flow conditions at specific wells. Well heads will be constructed of PVC, HDPE, fiberglass, stainless steel, or other nonporous material of suitable thickness.

4 Design Considerations

Design considerations meet the requirements of OAR 340-239-0110(1)(c)(A), below, as described in Sections 4.1 through 4.15. Each GCCS design will be certified to achieve comprehensive control of surface gas emissions by a professional engineer before GCCS construction takes place.

OAR 340-239-0110(1)(c)(A) *The Design Plan must be prepared and certified by a professional engineer. The following issues must be addressed in the design: Depths of solid waste, solid waste gas generation rates and flow characteristics, cover properties, gas system expandability, leachate and condensate management, accessibility, compatibility with filling operations, integration with closure end use, air intrusion control, corrosion resistance, fill settlement, resistance to the solid waste decomposition heat, and ability to isolate individual components or sections for repair or troubleshooting without shutting down entire collection system.*

The GCCS has been designed to be consistent with DEQ requirements to achieve comprehensive control of both lateral migration and surface emissions of LFG.

Issues related to compliance with OAR 340-239-0110 (1)(c)(A) are discussed in the following sections.

Applicable information used in the design of the GCCS is included in Appendix A (GCCS Master Plan), Appendix B (LFG Generation Model), Appendix C (Pressure Loss Calculations in LFG Header and Lateral Piping), Appendix D (Radius of Influence Calculations), Appendix E (Compressor Sizing), Appendix F (Surface Emissions Plan), and Appendix G (Alternative Operation and Monitoring Plan).

4.1 Depth of Refuse

The GCCS master plan incorporates vertical gas extraction wells for regions of the landfill with at least 55-70' of waste depth. Horizontal gas collectors will be used throughout the landfill and placed between waste lifts to provide gas collection in the shallower regions of fill and in areas of active fill. As described in Section 3.1, there will be at least 15' between the operational layer and the bottom of each vertical well's borehole.

Depths of refuse are calculated, at the time of the design of the GCCS, based upon existing topography and permit plan and record documentation of landfill liner grades. The landfill surface elevations are determined from aerial survey data at the time of the design.

4.2 Solid Waste Gas Generation Rates and Flow Characteristics

The maximum expected LFG flow rate for the site was used for sizing the GCCS. The LFG generation rate calculations were performed using the United States Environmental Protection Agency (EPA) Landfill Gas Emission Model (LandGEM) (values- k=0.04/year and L_0=80 m^3/Mg), historical waste receipts and the permitted design capacity of the facility. The maximum LFG generation rate projected to be approximately 6900 scfm.

The LandGEM emissions model is a design tool which uses the information available to project future operating conditions. This model was developed based upon operating conditions at a cross-section of landfills within the United States and is approved for use by the EPA. Actual operating parameters may dictate changes in the system flow characteristics and process equipment as the system is developed. The LandGEM model meets the requirements of OAR 340-239-0110(2).

LFG generation variables are discussed in Section 5.2 and LFG projections. The complete 2021 LandGEM report provided in Appendix B.

4.3 Landfill Cover Properties

The final cover design will incorporate a composite geosynthetic/low permeability soil barrier. The primary purpose of the final cover system units is to prevent precipitation infiltration that would generate additional leachate. However, the final cover system design also provides a significant barrier to LFG emission and air infiltration when combined with an active LFG extraction system. The GCCS will provide components for collecting LFG and relieving pressures from LFG from beneath the landfill covers.

4.3.1 Interim Cover

The size of the active operational areas of the Landfill is controlled using interim covers consisting of temporary plastic tarps. The interim soil cover, where used, will typically be a minimum of 12-inches thick. The temporary plastic covers are typically 12-mil, lightweight plastic with a nylon reinforcing scrim or 45-mil ethylene propylene diene monomer (EPDM) rubber. EPDM sheets are available in panels up to 200 feet by 200 feet. The cover material is held down by sandbags placed on a spacing of approximately 10 feet or anchored with specialized earth anchors in the case of EPDM cover. Sheet seams are sewn together, taped, or made by overlapping the sheets and placing sandbags along the seam. The seams will be shingled down slope to properly shed water. The interim cover will facilitate the control of landfill gas prior to final cover being put in place.

4.3.2 Final Cover

The final landfill cover inhibits the infiltration of stormwater and the migration of landfill gas. This cover will be installed periodically during the operating life and the closure of the Landfill. The final cover will consist of:

- An under-drainage layer to allow collection of landfill gas and control of landfill seeps.

- 24" of compacted low permeability soil having a maximum hydraulic conductivity of $1x10^{-5}$ cm/s.

- Geomembrane, most-likely a 60-mil linear-low density polyethylene (LLDPE) or other approved geomembrane.

- Drainage layer, either 12 inches of gravel or a geocomposite drainage layer

- Plantings, which would include a diverse grass/forb seed mix of native species, shallow-rooted shrubs, and limited areas of mixed forest where topsoil would be deep enough to ensure the integrity of the cover system.

In areas of the landfill under final cover, LFG collection efficiency is expected to increase to as much as 90% due to enhanced effectiveness of the cover to limit air infiltration and LFG emissions. Sections of the landfill already at final grade are currently covered with a LLDPE geomembrane.

4.4 Landfill Gas System Expandability

Expandability of the GCCS is achieved by installing tees with blind flanges along the transmission piping or providing expansion capabilities for additional LFG control devices. These flanges or expansion points provide planned access for expansion of the LFG transmission piping and LFG control device facility(s) in the future. Coffin Butte Landfill may require the installation of supplemental GCCS components to comply with State and Federal regulations at some point in the future. If that need is determined, an alteration will be submitted to the DEQ for review and concurrence prior to the installation of those components. Any needed design component will be installed and operational no later than 60 days after the date on which the area requires control.

4.5 Leachate and Condensate Management

Condensate generated in header, lateral, and horizontal collector piping will maintain drainage from landfill high points to condensate and leachate sumps or leachate cleanouts and drains installed at low points in the Landfill. The current GCCS system includes condensate sumps at low points in the header piping, which will be utilized in future GCCS designs. As shown on the GCCS Master Plan, all LFG piping will slope towards a condensate pump. If necessary, sumps will be upsized to handle condensate for the Landfill. Additional sumps may also be installed if low points are encountered in future designs.

Leachate is pumped from the LCS to an onsite pond for storage. As warranted, leachate is trucked off site for permanent disposal. The LCS is designed according to Subtitle D standards (40 CFR§257 and §258) and is part of the Solid Waste Disposal Permit.

4.5.1 Compressed Air and Liquid Conveyance

2" diameter SDR 9 HDPE piping will provide compressed air to pneumatic pumps for dewatering vertical wells and sumps. The piping will be in a shared trench with the LFG and liquid conveyance piping (see next paragraph) wherever possible to limit the amount of trenching needed in each GCCS design. The compressed air line will stub-up at each vertical well with an isolation valve for isolating individual pumps. The compressed air line will also have isolation and blow-off valves installed at strategic locations in the Landfill. Blow-off valves will allow the compressed air line to be cleaned out and the pressure to be released if necessary.

A 4" diameter liquid conveyance line will stub-up with an isolation valve at each vertical well, along with every compressed air line stub-up. Like the compressed air line, the liquid conveyance line will share a trench with LFG piping whenever possible. Liquid conveyance cleanouts will be installed in the piping every 200ft, comprised of wye-fittings, ball valves, and camlock fittings. Cleanouts are included with these features and at this quantity to allow for easy access to every point in the piping for cleaning by vacuum trucks and water trucks.

4.5.2 Vertical Well Pumps

Leachate extraction pumps in vertical wells will be pneumatic. The pump will operate using the compressed air line with an in-line regulator and will discharge into the 4" liquid conveyance line. This type of pump was selected because it is commonly used for landfill vertical well leachate pumping and can easily be integrated into the liquid conveyance and compressed air lines. The pump will be of a diameter is so that it will fit within the 6" carbon steel or HDPE pipe used for vertical wells. The pump will also be installed with a stabilizer

LFG well cap that will allow the pump to be easily accessible. The pump model selection is subject to change in future designs depending on the site and well specific pumping requirements

4.5.3 Air Compressor

In 2021, CBLF installed a Sullair 3709VB Series 50 HP rotary screw compressor to replace the former model Sullair ST2208 30 HP screw compressor. This larger compressor has a typical lifetime of 15 years and is capable of supplying enough air to operate all proposed pneumatic leachate extraction pumps cycling simultaneously. For more information regarding compressor sizing, please refer to Section 5.5

4.6 Compatibility with Filling Operations and Accessibility

Accessibility to the GCCS components is achieved by installing commonly accessed components (such as wellheads and monitoring ports) on relatively flat surfaces of the landfill or near the landfill's road network. Wellheads, piping risers, valves and monitoring ports will be installed above grade, or within vaults, to maintain accessibility.

At the time of this report, an active GCCS has been constructed and is operating in the Coffin Butte Landfill. Future additions or expansions of the GCCS will be designed to integrate the existing GCCS components currently operating at the Coffin Butte Landfill. As refuse filling operations proceed and portions of the site reach final or near-final grades, additional GCCS components will be installed. This method of installation allows GCCS components to be constructed while minimizing interference of the GCCS with ongoing filling operations.

4.7 Integration with Closure and End Use

Currently, the post-closure end-use for the site is unspecified and will likely be utilized as open space. Any modifications to the closure end-use must be approved by Coffin Butte Landfill personnel to evaluate their compatibility with the GCCS. Any items of concern related to maintaining and operating the GCCS will be mitigated by either altering the proposed post-closure end-use or by adjusting or modifying the GCCS in accordance with DEQ requirements.

4.8 Air Intrusion Control

Air intrusion will be minimized throughout the entire Landfill by the interim cover and the final cover described in Section 4.3. Where collectors, wells, or piping pass through the cover, a geomembrane boot will be used to prevent these regions from becoming an air intrusion source. Monthly well tuning and regular maintenance of the cover will also be essential in preventing air intrusion. The radius of influence of vertical wells, which is described in Section 5.3, was used to determine the length of solid pipe and determine a recommended vacuum for wells both on waste plateaus and slopes. By using both these values, the potential for air intrusion due to overpulling at wells will be minimized

4.9 Corrosion Resistance

Corrosion resistance of the GCCS is achieved through the use of corrosion resistant materials or materials that have a corrosion resistant coating. The primary components used in the construction of the GCCS are high density polyethylene (HDPE) and polyvinyl chloride (PVC) piping. All HDPE piping will have a minimum rating standard dimension ratio (SDR) of 17. All PVC piping will have a minimum rating of Schedule 40. Components will be inspected during routine GCCS monitoring for abrasion, chipping, or other potential deterioration of the components. If damage to the materials is observed that may be detrimental to the performance of the GCCS, the components will be replaced or repaired.

4.10 Resistance to Decomposition Heat

Resistance of the GCCS to the heat generated as a result of refuse decomposition was achieved through the use of materials tested and proven to withstand temperatures well above those typically found in landfills. The GCCS will be inspected during routine LFG system monitoring for heat damage. If heat damage of the GCCS components is observed and is believed to be detrimental to the operation of the GCCS, the cause of the elevated landfill temperature will be investigated and the GCCS will be adjusted or modified to mitigate the effects of the elevated temperatures.

The primary point of observation during routine LFG system monitoring will be at the individual wellheads. Each wellhead possesses either an integral thermometer or a connection for the use of portable thermometer. The extraction wells will generally be operated at temperatures of less than 131 °F unless an alternative temperature parameter is approved for an individual monitoring point. All wellhead components are visually inspected, and the control valve and monitoring connection physically exercised during each monitoring event, to insure free operation of the components.

In the event that the monitored LFG temperature exceeds 150°F, the well casing will be inspected via fiber optic camera or other suitable means to ensure that the integrity of the casing has not been compromised. Vertical extraction well casings will be constructed of schedule 40 carbon steel. Legacy casings may be schedule 80 PVC or HDPE. A compromised PVC or HDPE casing will typically show signs of physical deformation or internal "bulges" if excessive heat has been applied for a prolonged period of time. In the event that damage has occurred that negatively impacted the operations of the extraction well, the DEQ will be notified and a remedy for that extraction point proposed for review and concurrence.

Since the LFG stream cools as it is drawn through the piping system, the lateral and header piping will be exposed to relatively cooler gas temperatures than will the extraction wells and wellheads. These components will be inspected only in the event that a surface fire or other disturbance is observed.

4.11 Fill Settlement

Settlement will occur due to decomposition of the refuse. To accommodate refuse settlement, the GCCS components will be designed and installed with several features to account for this settlement, including:

- LFG extraction wellheads connected to the LFG transmission piping via a flexible pipe or hose connection. This allows the LFG piping to accommodate changes in the orientation of the LFG transmission piping or LFG extraction well.
- LFG transmission piping sloped at sufficient grades (a minimum 3.0 percent within the waste limits, and 0.5 percent outside the waste limits) so that reasonable amounts of differential and total settlement may occur without causing pipe breakage or disrupting the overall flow gradient of the LFG transmission piping.
- HDPE piping used for the construction of the header piping and transmission system. HDPE piping is flexible and absorbs differential settlement without breaking or cracking.

4.12 Isolation of Individual Components

The GCCS will be designed to include isolation valves at gas header, air, and liquid forcemain junctions and branches so as to allow for the ability to isolate individual components or sections for repair or troubleshooting without shutting down the entire collection system

4.13 Landfill Gas Extraction Component Construction

OAR 340-239-0110(2)(I) *The landfill gas extraction components must be constructed of polyvinyl chloride (PVC), high density polyethylene (HDPE) pipe, fiberglass, stainless steel, or other nonporous corrosion resistant material of suitable dimensions to: Convey projected amounts of gases; withstand installation, static, and settlement forces; and withstand planned overburden or traffic loads. The collection system must extend as necessary to comply with emission and migration standards. Collection devices such as wells and horizontal collectors must be perforated to allow gas entry without head loss sufficient to impair performance across the intended extent of control. Perforations must be situated with regard to the need to prevent excessive air infiltration.*

Design considerations related to compliance with OAR 340-239-0110(2)(I) are discussed in the following sections:

4.13.1 Materials

The GCCS components will be constructed of PVC, HDPE, fiberglass, corrosion resistant steel, Neoprene (gaskets and seals) and other non-porous corrosion resistant materials.

4.13.2 Component Sizing

The final development piping network, blowers, and flares are sized for a maximum estimated flow of 6,900 scfm with the ability for expansion. The GCCS facilities will be expanded as needed to handle 6,900 scfm as estimated by the EPA LandGEM emissions model. This accounts for the entire disposal area, at the final grade development elevations of the landfill. Capacity of the extraction and treatment system components will be phased in as LFG generation and extraction rates increase. Please see Section 3.5 for full discussion of the control systems.

4.13.3 Component Loading

The GCCS components were designed to withstand the estimated installation, static, settlement, overburden, and traffic loads. Installation loads were determined to be insignificant for GCCS components (PVC, HDPE, and carbon steel) based on the installation methods used. Static loads from the vacuums applied to the GCCS components and applied loads on the GCCS were both evaluated. Vacuum loads required for the GCCS operation were compared to, and found to be less than, the allowable vacuum loads for the GCCS components. Foundations used for GCCS components were designed to handle the applied loads. The applied loads on GCCS components within the landfill, as well as settlement forces, cannot accurately be predicted due to the non-homogeneous nature of the refuse within the landfill.

The GCCS components within the landfill are consistent with those at other landfills that have been in place for extended periods of time (in excess of 15 years) and verified to withstand applied static and settlement forces. Overburden and traffic loads for the LFG transmission piping are less than the allowable loads recommended by the piping manufacturer.

4.13.4 System Expansion

The GCCS shall be expanded as necessary to comply with DEQ requirements. The Coffin Butte Landfill will conduct monitoring and document compliance of the GCCS, in accordance with DEQ requirements. If the GCCS at the Coffin Butte Landfill does not meet the measures of performance set forth by DEQ, the GCCS will be adjusted or modified in accordance with DEQ requirements.

4.13.5 Component Perforation

The vertical well and interim horizontal trench collector elements will be perforated as shown on the design plans (Appendix A) or as approved by the design engineer at the time of installation, to allow LFG entry

without inducing head losses sufficient to impair performance across the intended extent of control. The perforation patterns used for the Coffin Butte Landfill GCCS design have been successfully used in previous LFG control applications.

4.13.6 Air Infiltration

The LFG collection elements were designed to prevent excessive air infiltration through the use of solid pipe and solid backfill near the ground surface for vertical LFG extraction wells and interim horizontal trenches in the perimeter slope area. Hydrated bentonite plugs and geomembrane seals, if warranted, will be provided around vertical well casings and interim horizontal trench access piping, where they penetrate the landfill final cover or interim cover systems. Further, air intrusion control will be accomplished through monitoring of the standard operational procedures (SOP) for the LFG collection elements in accordance with DEQ and NSPS requirements. If the GCCS does not meet the SOP, it will be adjusted or modified in accordance with DEQ and NSPS requirements.

Near surface collectors may be used on occasion to prevent surface emissions and are approved for operation with higher than normal oxygen readings.

4.14 Landfill Gas Extraction Component Installation

OAR 340-239-0110(2)(J) *Vertical wells must be placed so as not to endanger underlying liners and must address the occurrence of water within the landfill. Holes and trenches constructed for piped wells and horizontal collectors must be of sufficient cross-section so as to allow for their proper construction and completion including, for example, centering of pipes and placement of gravel backfill. Collection devices must be designed so as not to allow indirect short circuiting of air into the cover, into the solid waste, into the collection system, or gas into the air. Any gravel used around pipe perforations should be of a dimension so as not to penetrate or block perforations.*

Design considerations related to compliance with OAR 340-239-0110(2)(J) are discussed in the following sections:

4.14.1 Component Placement

Depths of refuse were calculated, at the time of the design of the GCCS, based upon the permit plan final grades and record documentation of landfill liner grades. Vertical LFG extraction wells will be designed to extend from the landfill surface to a maximum depth of 15 feet above the landfill base. Any changes made to borehole depths during design or construction must be verified and acknowledged by the following representatives: QA/QC Reviewer, Design Engineer, CQA Inspector, Environmental Manager, Surveyor, and Driller. Under no circumstances shall drilling begin without providing all the aforementioned signatures. Any changes to well location or depth shall require signatures to be obtained again.

4.14.2 Leachate

The occurrence of leachate within the landfill will be addressed by the LCS as stated in Section 4.5 of this Design Plan. Leachate management within the landfill with a composite liner will be accomplished through the LCS which includes a leachate drainage layer, perforated collection piping, side slope risers with liquid pumping equipment, and liquid storage and disposal systems. A force main could then be used to convey the extracted liquids to the leachate storage facilities

If free liquids are encountered, the drilling contractor will attempt to drill through the perched zone of liquids allowing drainage into the underlying waste mass and the LCS. In the event that the zone of perched liquids cannot be penetrated, the well installation may be terminated. If necessary, appropriate measures will be taken to complete the well installation procedure at a nearby location.

If perched liquids are observed within the extraction wells after installation, and it is determined that the liquid level is restrictive to efficient LFG extraction, attempts may be made to reduce the leachate level. This

is typically accomplished by periodic pumping of the liquids using either electric or pneumatic pumping systems. Liquids removed from the well casings will be discharged to the LCS.

4.14.3 Wells and Horizontal Trench Collectors

Vertical wells and interim horizontal trench collectors, constructed for LFG collection elements, are of sufficient cross-section to allow for their proper construction and completion, including centering of the pipes and placement of gravel backfill. The wells and interim trenches will be constructed under supervision of a construction quality assurance program implemented by the Coffin Butte Landfill and verified to be properly constructed, as indicated on the design plans in Appendix A.

4.14.4 Component Short Circuiting

LFG collection elements are designed to prevent air infiltration through the cover, refuse contamination of the collection elements, and direct venting of LFG to the atmosphere. Air intrusion control will be verified through monitoring of LFG quality at the extraction components (note exemption for near surface collectors in Section 4.13.6), monitoring of surface emission levels and maintenance of the landfill cover in accordance with DEQ requirements. Separation of the collection elements from the refuse is accomplished by placing gravel backfill in the annular borehole space around extraction wells casings and the interim horizontal trench pipes, providing a filter pack between the refuse and the LFG collection elements. Direct venting of the LFG to the atmosphere is avoided by operating the GCCS under a controlled application of vacuum and the quarterly monitoring of surface emissions.

4.14.5 Gravel Backfill

Gravel of sufficient size is specified to prevent penetration or blockages of the LFG collector pipe perforations. Gravel (non-calcareous) to be utilized will be a nominal 1 to 3-inch in size.

4.15 Landfill Gas Extraction Components Connections to LFG Transmission Piping

OAR 340-239-0110(2)(K) *Collection devices may be connected to the collection header pipes below or above the landfill surface. The connector assembly shall include a positive closing throttle valve, any necessary seals and couplings, access couplings and at least one sampling port. The collection devices shall be constructed of PVC, HDPE, fiberglass, stainless steel, or other non-porous material of suitable thickness.*

The collection devices are connected to the collection header pipes using lateral piping. The lateral piping will be connected to the header piping either above or below the landfill surface, as required by field conditions at the time of installation. The connector assemblies and collection devices (vertical extraction wellheads) are detailed in section 3.4 of this design plan.

5 Calculations

The calculations described in this section serve to support the GCCS Design in Section 3 and the design considerations in Section 4.

5.1 Pipe Loading

In addition to their suitability to resisting corrosion and decomposition due to heat, the GCCS components must withstand loading due to installation, static, and settlement forces as well as overburden or traffic loads per OAR 340-239-0110(2)(a)(I). Installation forces are negligible for the PVC and HDPE pipe selected as well as pressure due to applied vacuum within piping. The static pressure due to waste was determined at a depth of 230ft, which is the difference in elevation between the current surface and the well with the highest elevation per the GCCS Master Plan. Using a waste density of 2,000 lb/yd^3 and the equation below, the maximum pressure in a vertical well was determined to be 118.3 psi. The maximum pressure was then compared to the collapse pressure for Schedule 80 PVC, which is 343 psi for 6" diameter pipe. This result indicates the static loading will not cause pipe collapse even at the deepest regions of fill.

$$P = \varrho D$$

where,

P = Static pressure, ϱ = Waste density, D = depth of waste

The pipe is assumed to be capable of resisting most settlement forces due to the materials use historically in Landfills. However, there is no accurate way to predict what settlement forces will be. Vertical extraction well casings are to be made of 6" schedule 40 carbon steel, which has a collapse pressure significantly higher than the PVC used in the above calculation. By installing most GCCS piping and vertical wells in areas that have reached final fill, the overall loading on the GCCS due to settlement will be reduced as some of the initial waste settlement will have occurred prior to pipe installation. Resistance of header and lateral piping to traffic loads will be considered on a case-by-case basis and will depend on the depth of pipe burial and weight of traffic loads. If necessary, corrugated metal or ductile iron pipe will be used to carry the gas collection piping and provide resistance to loads.

5.2 Gas Generation and Collection

As stated in 340-239-0110(1)(c)(C) the gas mover equipment must "be designed to handle the maximum expected gas flow rate from the entire area of the landfill that warrants control over the intended use period of the gas control or treatment system equipment". Because a gas collection and control system is already in place at Coffin Butte Landfill, actual flow data may be used to project the maximum expected gas generation flow rate along with the equation from 40 CFR 60.755(a)(1)(ii):

$$Q_m = \sum_{i-1}^{n} 2kL_0M_i(e^{-kt}i)$$

where,

Q_m = maximum expected gas generation flow rate, cubic meters per year

L_0 = methane generation potential, cubic meters per megagram solid waste

k = methane generation rate constant, year^{-1}

M_i = mass of solid waste in the i^{th} section, megagrams

t_i = age of the i^{th} section, years

The EPA's Landfill Gas Emissions Model was used for projecting maximum LFG generation rates. The results of the LandGEM model ran for CBLF is shown in Appendix B.

5.2.1 Waste Types

The LandGEM uses the waste placed each year, historically and in the future, as an input, which is represented by M_i in the equation above. Waste totals and waste composition for each year were provided by Republic and previous LandGEM models for CBLF. It was assumed that the future waste composition would remain the same as the current composition and that the Landfill would take in approximately 800,000 tons of waste each year. The waste was split into five different categories for the LandGEM: MSW (70.5%), Special Wastes (8%), Construction & Demolition (CDL) (3%), Organics (3%) and Inert (15.5%).

5.2.2 Methane Generation Rate and Methane Generation Potential

In 2021, The LandGEM was calibrated to determine past and future gas generation rates at the Landfill using a bulk waste model that was composed from an amalgamation of sperate gas generation curves from each specific waste stream accounted for at the Landfill.

Coffin Butte Landfill accepts predominantly MSW waste, but also has a significant waste influx from burn waste and construction and demolition debris due to forest fires in the area. These waste streams contribute less to gas generation than typical MSW and in some cases are completely inert, as in the case of charred or burned debris. ESI opted to use an L_0 value of 80 m^3/Mg rather than the conventional value of 100 m^3/Mg, which would be typical of rural MSW landfills with limited recycling such as Coffin Butte, to account for these other waste streams.

In the bulk model, a k value of 0.04 $year^{-1}$ was used. This value is typical of a landfill within the climate range that Coffin Butte is located. Additional models were ran using k values of 0.03 and 0.05, but the best fit curve, when compared to actual gas collection records, was generated at a k value of 0.04.

The requisite parts that composed the final bulk model were LandGEM projections of each individual waste stream, each with their own specific k and L_0 values incorporated. These values are shown below in Table 1.

Table 1: The percent volume, gas generation rate and gas generation potential listed for each waste type that has been or will be accepted at Coffin Butte Landfill.

Waste Type	k (Units of $year^{-1}$)	L_0 (m^3/Mg)	Waste Stream (% volume)
MSW	0.04	115	70.5
C&D	0.03	20	3
Organics	0.05	130	3
Special Wastes	0.03	20	8
Inert	0	0	15.5

5.2.3 Landfill Gas Generation

Because the header and lateral piping is expected to be in use longer than 15 years, pipe sizing, which is discussed in Section 5.4, is based on the maximum gas generation rate for the waste mass shown in the GCCS Master Plan in Appendix A.

According to the EPA's AP-42, a collection efficiency of 75% is a recommended default assumption although it can range from 50-95%. Because Coffin Butte Landfill makes use of a temporary cover for active waste areas and has not recorded methane surface emissions, a collection efficiency of 75% is assumed to be a conservative collection efficiency from which to base the capacity of the GCCS design. This collection

efficiency will be reevaluated over time as more flare data and more accurate well flow data becomes available.

Table 2 shows the projected LFG generated and LFG collected for 15 years from now, when the waste placed in the Master Plan is complete, and when the LandGEM projects gas generation will be at a maximum. In 2036 the projected LFG Collected at the enclosed flare assuming a 75% collection efficiency is 4366 scfm. This is well over the 3,000 scfm capacity of the current blower/flare skid, excluding the utilization of the PNGC LFGTE plant. The LFG collected at the skid is expected to reach over 3,000 scfm in 2022. If the actual collected LFG matches the LandGEM projections, the flare system will need to be resized before this point. Pipe sizing for the GCCS Master Plan is based on the predicted LFG collected in 2047, which is two years after final waste placement is complete and the model is projecting the maximum LFG generation of 6900 scfm of LFG and 5223 scfm at 75% collection efficiency.

Table 2: Projected LFG Generated and LFG Collected with 75% collection efficiency for 2022, 2036, and 2045.

Year	Projected LFG Generated (cfm)	Projected LFG Collected (cfm)
2022	4381	3286
2036	6181	4366
2045	6900	5175

5.3 Radius of Influence and Well Spacing

The DEQ requires that "active collection wells, horizontal collectors, surface collectors, or other extraction devices" be spaced as necessary to achieve compliance with OAR 340-239-0110(2). The sufficient density to achieve this point of compliance is met by the well spacing as shown on the GCCS Master Plan (Appendix A), which is based on the calculated radius of influence (ROI) for each well. The goal in the ROI calculation was to maximize the radius while preventing air intrusion and to determine the vacuum necessary to reach the maximum radius.

The calculation of ROI for each well is shown in Appendix D and is dependent on several factors including length of solid well piping, waste permeability to LFG both vertically and horizontally, waste density, methane generation rate per unit mass, well vacuum, and the slope on which a well is placed. For the purpose of this design, the radius of influence was calculated assuming higher waste density and typical waste horizontal permeability which are shown in Table 3. A higher waste density was chosen due to known historical operational standards and waste composition data provided by Republic For compacted waste, the ratio of horizontal to vertical permeability to LFG can range anywhere from 2:1 to 10:1. For this design, a permeability ratio of 6:1 was used because it is a standard value and because the landfill cover used at the Landfill should make the ratio even higher.

Table 3: Values that were used in calculating the radius of influence for wells at Coffin Butte Landfill.

Variable	Value
Permeability	$5 \cdot 10^{-4}$ cm/sec
Waste Density	2,000 lb/yd^3
Gas Generation	0.1

For the purpose of calculating radius of influence, wells at Coffin Butte Landfill were split into three different categories: wells on a 3:1 slope, wells on a 4:1 slope, wells on a 10:1 slope, and wells on a 1:0 slope (Waste Plateaus). Table 4 lists the ROI for each category of wells, and the ROI calculations for each individual well are also shown in Appendix D.

Table 4: ROI for each vertical well category along with solid pipe length and well vacuum needed.

Well Slope (run:rise)	Radius of Influence (ft)	Solid Pipe Length (ft)	Well Vacuum (in H20)
3:1	72.0	30	1.83
4:1	84.9	30	2.65
10:1	111.4	30	4.88
1:0	120.0	30	5.76

5.4 LFG Pipe Sizing

The final GCCS headers and laterals will need to be sized for a total potential system LFG flow of 6900 SCFM. This LFG flow rate is based on the total projected gas generation simulated from the LandGEM (Shown in Appendix B). The Master Plan Drawings (shown in Appendix A) have the GCCS headers and laterals sized so that the pressure drop between the blowers and the LFG wellheads is less than 20" W.C. for the maximum projected flow rate. This is to ensure that sufficient vacuum is available to all wells. Additionally, header and lateral pipes are sized for a pressure drop less than 1" W.C. per 100 ft of pipe per Republic Standards section 3.7.7.

The final design will have an 18" diameter perimeter header with exception of the southern portion of pipe that will be 24" diameter pipe. The perimeter header will be installed outside of waste when possible. The 24" diameter header pipe will allow for a lower pressure drop to the wells in Cell 6. Sumps are installed along the parameter header at low points.

Currently, an 18" diameter perimeter header has been installed along the South and East side of Cells 4 and 5. Header piping over waste is designed to traverse along the haul roads whenever feasible. Installing the header along the haul road allows for ease of installation, repair, and system troubleshooting.

An 18" diameter crossover header is recommended to be installed to allow for multiple pathways to the wells on the North side of the landfill. This crossover header also allows a direct route for the gas coming from the top of the wellfield prior to completion of the landfill. The crossover over will be installed as the haul road extends each year until the landfill reaches final grades. See Appendix C for more information regarding pressure loss and header sizing.

The Darcy-Weisbach equation listed below is used to calculate the pressure loss through pipe segments. Drawing M2.04 shows the pipe length, the pipe size, the flow rates and the calculated pressure drops per section of pipe.

$$\Delta p = f_D \frac{L * \rho * V^2}{2 * D}$$

$\Delta p - Pressure\ Loss$

$f_D - Darcy\ (Moody) Friction\ Factor$

$L - Length\ of\ Pipe$

$\rho - Density\ of\ Landfill\ Gas$

$V - Velocity\ \ of\ Landfill\ Gas$

$D - Inside\ Diameter\ of\ Pipe$

Assumptions:

- Landfill gas consists of 50% Methane by volume and 50% Carbon Dioxide by volume.
- The gas is 100% saturated with water vapor
- The gas is at 100 degrees Fahrenheit
- The vacuum at the blowers is 50 inches of water column.
- Small radius of influence wells generate 30 SCFM of LFG.
- Lange radius of influence wells generate 55 SCFM of LFG.
- Header piping in waste is assumed to be HDPE SDR 17 and outside of waste is assumed to be HDPE SDR 26 in accordance with Republic's SOP on Landfill Gas Design section 3.7.7.
- Header segment calculations use the longer distances or piping from points, even is shorter routes exist, this it to ensure piping is oversized, rather than undersized.
- These calculations assume all header isolation valves are open in order to accommodate proper liquid drainage.

See Appendix C for more information regarding pressure loss and header sizing.

5.5 Compressor Sizing

The compressor described in Section 4.5.1 will accommodate the air flow requirements of 160 QED AP4+ pneumatic pumps cycling simultaneously. This quantity of pumps was determined by taking the number of projected vertical wells installed in 2036 and multiplying by 70% which correlates with the current number of vertical wells that house leachate extraction pumps. This is a worst-case model of air requirements near the end of the estimated life of the air compressor equipment. The air compressor is adequately sized to serve every pump when the landfill has reached the extent of the current GCCS Master Plan; however, this is past the expected 15 year life of the compressor. A new air compressor will be selected and sized accordingly when the current compressor reaches the end of its operational life.

The air usage for each pump was determined from the pump specification sheet provided by QED and shown in Appendix E. The air consumption for one pump at an average well depth of 120ft is 1.1 SCF/gal. Based upon typical usage (pumps cycling at 40% capacity), we find that the gallons per minute used would be 5 gpm. These two values multiplied together give us the required air flow rate per pump and can be directly compared to compressor sizes for system sizing. A 120ft well depth on average was used because the air flow requirements at that depth are at a peak for our expected well depth range. These calculations can be viewed in Appendix E.

6 Operations

OAR 340-239-0110(2) outlines operational standards for collection and control systems. CBLF currently complies with their Title V Permit and the NSPS. In meeting these requirements, CBLF has submitted a Startup, Shutdown, and Malfunction Plan; and a Surface Emission Monitoring Plan. CBLF also operates the GCCS in a manner that complies with requirements and has provided all reports required by their permit.

The following sections will address new operational standards required by OAR 340-239-0110(2).

6.1 Surface Emission Monitoring

The Coffin Butte Landfill currently conducts, at a minimum, quarterly surface emissions monitoring in accordance with NSPS requirements. The landfill will continue to conduct surface monitoring in accordance with DEQ requirements in OAR 340-239-0600)(1). If the GCCS at the Coffin Butte Landfill does not meet the measures of performance set forth in OAR 340-239-0200, the GCCS will be adjusted or modified in accordance with the DEQ to meet these requirements. These adjustments or modifications may include the installation of additional collection elements, cap and cover repairs, or other actions defined by field conditions at the time of monitoring.

All GCCS components containing LFG or under positive pressure will be monitored at minimum, quarterly for leaks. Any component leak exceeding 500 ppmv methane will be tagged and repaired within 10 days of discovery. Any component leak exceeding 250 ppmv will be recorded pursuant to OAR 340-239-0700(2)(a)(S). Quarterly testing at CBLF may be conducted prior to scheduled maintenance and planned outage time periods of PNGC's LFGTE facility.

6.2 Emission Mitigation Measures

OAR 340-239-0110 (1)(c)(E) *The Design Plan must include a description of potential mitigation measures to be used to prevent the release of methane or other pollutants into the atmosphere during the installation or preparation of wells, piping, or other equipment; during repairs or the temporary shutdown of gas collection system components; or, when solid waste is to be excavated and moved.*

6.2.1 Installation Mitigations

In order to mitigate the release of LFG into the atmosphere during installation and expansion of the GCCS, vertical LFG extraction wells will be set and securely capped or connected to existing vacuum source within the GCCS infrastructure, immediately following drilling. Boreholes will then be backfilled as indicated in the design plans in Appendix A. Under no circumstances will a borehole be left open to atmosphere for times exceeding those needed for proper well setting and installation during construction.

Horizontal collectors will be installed and backfilled as indicated in the design plans in Appendix A immediately following trenching. If a collector is not able to be installed immediately, the trench will be backfilled in order to mitigate LFG release into the atmosphere. Installed collectors will remain securely capped until connected to existing GCCS infrastructure.

6.2.2 Operational Mitigations

During repairs or temporary shutdown of GCCS components, the system will be isolated, if possible, to not cause a complete shutdown of the system while repairs or expansions are being made. Repairs requiring the complete shutdown of the GCCS will be carried out in an expedited manner in which minimizes downtime or allows for partial operation of the GCCS via isolation if possible.

When solid waste is to be moved or excavated, approved fill and cover material will be placed upon the area immediately following the end of the operations. Ongoing excavations will be covered with daily cover as to mitigate LFG emissions into the atmosphere while active operations are not occurring.

In the event of any temporary shutdown due to an emergency, catastrophic event, or landfill fire, DEQ will be notified in accordance with OAR 340-239-0700(3)(n).

6.3 Asbestos and Non-Productive Waste

Outside of the designated asbestos areas, no areas of the landfill were determined to be non-productive; therefore, no areas of the landfill have been excluded from the coverage of the GCCS. As per OAR 340-239-0110(2)(a)(H), a non-productive area may be excluded from control if the total excluded area can be shown to contribute less than one percent (1%) of the total amount of methane emissions from the landfill. If an area(s) is determined to be non-productive at a future date, an application to exclude these areas from the operations of the GCCS will be submitted and all calculations, data, and documentation will be submitted to DEQ. Methane emissions from areas in question will be calculated with a method in accordance with OAR 340-239-0800(5).

All future active areas with active and passive collection systems will be installed with liners on the bottoms and all sides in which gas is to be collected. The liner will be installed as required by 40 C.F.R § 258.40 design criteria.

6.4 Alternative Compliance Options

Per NSPS 40 CFR §60.752(b)(2)(i)(B), the previous GCCS design plan included any alternatives to "the operational standards, test methods, procedures, compliance measures, monitoring, record keeping or reporting provisions of §60.753 through §60.753 proposed by the owner or operator." The current approved AOMP for Coffin Butte Landfill is shown in Appendix G. The purpose of this AOMP is to ensure the wellfield can be reasonably operated to maintain compliance and prevent fugitive emissions.

The current AOMP will be reviewed and resubmitted to DEQ for approval in pursuant to OAR 340-239-0110(1)(c)(D).

6.5 Wellhead Sampling

Each wellhead will have a sampling port and measuring devices to comply with the following, pursuant of OAR 340-239-0110(3):

- Sample port in which nitrogen and oxygen concentrations in the landfill gas may be monitored on a monthly basis as provided in OAR 340-239-0600(3).
- Sampling port in which landfill gas temperature may be monitored on a monthly basis as provided in OAR 340-239-0600(3).
- Sampling port in which gauge pressure in the gas collection header may be measured on a monthly basis as provided in OAR 340-239-0600(2)(d).

6.6 Well Raising

Continuous operation of the GCCS as detailed in requirements OAR 340-239-0110(2)(a)(A) and OAR 340-239-0110(2)(a)(B) do not apply to wells that are being raised, provided they are being raised due to new fill being added or compacted within the immediate vicinity around the well and that once installed the gas collection extension is sealed and capped until the well is reconnected to a vacuum source.

Wells being raised due to new waste deposition will be sealed and capped in a manner pursuant to these requirements and will be reconnected to a vacuum source as soon as filling operations cease within the immediate vicinity of the raised well.

6.7 GCCS Operation

The components and design considerations within this GCCS design plan allow for CBLF to operate the GCCS in accordance with all monitoring and operational practices detailed in OAR 340-239-0600. Currently the GCCS is monitored twice each month. A monthly SOP review is provided by the design engineer along with a report to address exceedances, operational concerns, and other compliance issues so that points of noncompliance with any section of OAR 340-239-0600 may be addressed in an expedient manner.

A M3.01 LFG VERTICAL EXTRACTION WELL WITH LIQUID EXTRACTION PUMP DETAIL

NOTES:
1. VERTICAL EXTRACTION WELLS TO BE INSTALLED WITH 20' MINIMUM SOLID PIPE, 15' IF OTHERWISE NOTED AND EXPLAINED.
2. WELL BORE REINFORCEMENT GRATES TO BE RELOCATED FROM ABOVE GRADE TO BELOW GRADE AFTER BACKFILLING COMPLETE. THESE GRATES ARE REQUIRED FOR ALL WELLS AND BOREHOLE ABANDONMENTS IN ORDER TO PROVIDE A SAFEGUARD FROM POTENTIAL COLLAPSE OF BACKFILL MATERIAL.
3. AIR AND LIQUID CONVEYANCE STUB-UPS TO BE LOCATED AT EVERY VERTICAL LFG COLLECTION WELL AND WHERE APPLICABLE.

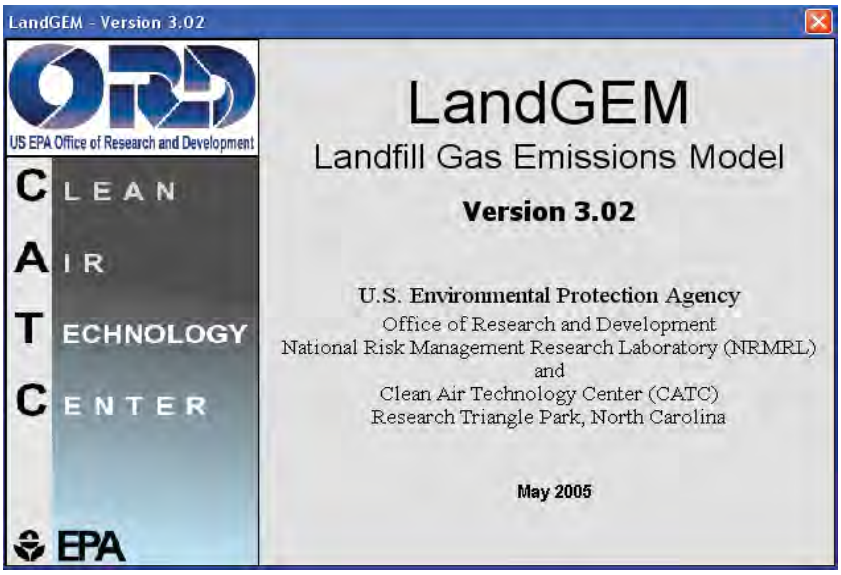
APPENDIX B: LFG GENERATION MODEL (LANDGEM)



Summary Report

Landfill Name or Identifier: Special Waste CB Landfill

Date: Monday, May 10, 2021

Description/Comments:

About LandGEM:

First-Order Decomposition Rate Equation:

$$Q_{CH_4} = \sum_{i=1}^{n} \sum_{j=0.1}^{1} kL_o \left(\frac{M_i}{10} \right) e^{-kt_{ij}}$$

Where,

Q_{CH4} = annual methane generation in the year of the calculation ($m^3/year$)

i = 1-year time increment

n = (year of the calculation) - (initial year of waste acceptance)

j = 0.1-year time increment

k = methane generation rate ($year^{-1}$)

L_o = potential methane generation capacity (m^3/Mg)

M_i = mass of waste accepted in the i^{th} year (Mg)

t_{ij} = age of the j^{th} section of waste mass M_i accepted in the i^{th} year (*decimal years*, e.g., 3.2 years)

LandGEM is based on a first-order decomposition rate equation for quantifying emissions from the decomposition of landfilled waste in municipal solid waste (MSW) landfills. The software provides a relatively simple approach to estimating landfill gas emissions. Model defaults are based on empirical data from U.S. landfills. Field test data can also be used in place of model defaults when available. Further guidance on EPA test methods, Clean Air Act (CAA) regulations, and other guidance regarding landfill gas emissions and control technology requirements can be found at http://www.epa.gov/ttnatw01/landfill/landflpg.html.

LandGEM is considered a screening tool — the better the input data, the better the estimates. Often, there are limitations with the available data regarding waste quantity and composition, variation in design and operating practices over time, and changes occurring over time that impact the emissions potential. Changes to landfill operation, such as operating under wet conditions through leachate recirculation or other liquid additions, will result in generating more gas at a faster rate. Defaults for estimating emissions for this type of operation are being developed to include in LandGEM along with defaults for convential landfills (no leachate or liquid additions) for developing emission inventories and determining CAA applicability. Refer to the Web site identified above for future updates.

Input Review

LANDFILL CHARACTERISTICS

Landfill Open Year	**1978**	
Landfill Closure Year (with 80-year limit)	**2045**	
Actual Closure Year (without limit)	***2045***	
Have Model Calculate Closure Year?	**No**	
Waste Design Capacity		*megagrams*

MODEL PARAMETERS

Methane Generation Rate, k	**0.030**	*year^{-1}*
Potential Methane Generation Capacity, L_o	**20**	*m^3/Mg*
NMOC Concentration	**600**	*ppmv as hexane*
Methane Content	**50**	*% by volume*

Summary Report

Landfill Name or Identifier: Organic waste CB Landfill Model

Date: Monday, May 10, 2021

Description/Comments:

About LandGEM:

First-Order Decomposition Rate Equation:

$$Q_{CH_4} = \sum_{i=1}^{n} \sum_{j=0.1}^{1} kL_o \left(\frac{M_i}{10} \right) e^{-kt_{ij}}$$

Where,

Q_{CH4} = annual methane generation in the year of the calculation ($m^3/year$)
i = 1-year time increment
n = (year of the calculation) - (initial year of waste acceptance)
j = 0.1-year time increment
k = methane generation rate ($year^{-1}$)
L_o = potential methane generation capacity (m^3/Mg)
M_i = mass of waste accepted in the i^{th} year (Mg)
t_{ij} = age of the j^{th} section of waste mass M_i accepted in the i^{th} year (*decimal years*, e.g., 3.2 years)

LandGEM is based on a first-order decomposition rate equation for quantifying emissions from the decomposition of landfilled waste in municipal solid waste (MSW) landfills. The software provides a relatively simple approach to estimating landfill gas emissions. Model defaults are based on empirical data from U.S. landfills. Field test data can also be used in place of model defaults when available. Further guidance on EPA test methods, Clean Air Act (CAA) regulations, and other guidance regarding landfill gas emissions and control technology requirements can be found at http://www.epa.gov/ttnatw01/landfill/landflpg.html.

LandGEM is considered a screening tool — the better the input data, the better the estimates. Often, there are limitations with the available data regarding waste quantity and composition, variation in design and operating practices over time, and changes occurring over time that impact the emissions potential. Changes to landfill operation, such as operating under wet conditions through leachate recirculation or other liquid additions, will result in generating more gas at a faster rate. Defaults for estimating emissions for this type of operation are being developed to include in LandGEM along with defaults for convential landfills (no leachate or liquid additions) for developing emission inventories and determining CAA applicability. Refer to the Web site identified above for future updates.

Input Review

LANDFILL CHARACTERISTICS

Landfill Open Year	**1978**	
Landfill Closure Year (with 80-year limit)	**2045**	
Actual Closure Year (without limit)	***2045***	
Have Model Calculate Closure Year?	**No**	
Waste Design Capacity		*megagrams*

MODEL PARAMETERS

Methane Generation Rate, k	**0.050**	*year $^{-1}$*
Potential Methane Generation Capacity, L_o	**130**	*m^3/Mg*
NMOC Concentration	**600**	*ppmv as hexane*
Methane Content	**50**	*% by volume*

GASES / POLLUTANTS SELECTED

Gas / Pollutant #1:	**Total landfill gas**
Gas / Pollutant #2:	**Methane**
Gas / Pollutant #3:	**Carbon dioxide**
Gas / Pollutant #4:	**NMOC**

Summary Report

Landfill Name or Identifier: C&D CB Landfill Model

Date: Monday, May 10, 2021

Description/Comments:

About LandGEM:

First-Order Decomposition Rate Equation:

$$Q_{CH_4} = \sum_{i=1}^{n} \sum_{j=0.1}^{1} kL_o \left(\frac{M_i}{10} \right) e^{-kt_{ij}}$$

Where,

Q_{CH4} = annual methane generation in the year of the calculation ($m^3/year$)

i = 1-year time increment

n = (year of the calculation) - (initial year of waste acceptance)

j = 0.1-year time increment

k = methane generation rate ($year^{-1}$)

L_o = potential methane generation capacity (m^3/Mg)

M_i = mass of waste accepted in the i^{th} year (Mg)

t_{ij} = age of the j^{th} section of waste mass M_i accepted in the i^{th} year (*decimal years*, e.g., 3.2 years)

LandGEM is based on a first-order decomposition rate equation for quantifying emissions from the decomposition of landfilled waste in municipal solid waste (MSW) landfills. The software provides a relatively simple approach to estimating landfill gas emissions. Model defaults are based on empirical data from U.S. landfills. Field test data can also be used in place of model defaults when available. Further guidance on EPA test methods, Clean Air Act (CAA) regulations, and other guidance regarding landfill gas emissions and control technology requirements can be found at http://www.epa.gov/ttnatw01/landfill/landflpg.html.

LandGEM is considered a screening tool — the better the input data, the better the estimates. Often, there are limitations with the available data regarding waste quantity and composition, variation in design and operating practices over time, and changes occurring over time that impact the emissions potential. Changes to landfill operation, such as operating under wet conditions through leachate recirculation or other liquid additions, will result in generating more gas at a faster rate. Defaults for estimating emissions for this type of operation are being developed to include in LandGEM along with defaults for convential landfills (no leachate or liquid additions) for developing emission inventories and determining CAA applicability. Refer to the Web site identified above for future updates.

Input Review

LANDFILL CHARACTERISTICS

Landfill Open Year	**1978**	
Landfill Closure Year (with 80-year limit)	**2045**	
Actual Closure Year (without limit)	***2045***	
Have Model Calculate Closure Year?	**No**	
Waste Design Capacity		*megagrams*

MODEL PARAMETERS

Methane Generation Rate, k	**0.030**	*year $^{-1}$*
Potential Methane Generation Capacity, L_o	**20**	*m^3/Mg*
NMOC Concentration	**600**	*ppmv as hexane*
Methane Content	**50**	*% by volume*

GASES / POLLUTANTS SELECTED

Gas / Pollutant #1:	**Total landfill gas**
Gas / Pollutant #2:	**Methane**
Gas / Pollutant #3:	**Carbon dioxide**
Gas / Pollutant #4:	**NMOC**

	Dichloromethane (methylene chloride) - HAP	14	84.94		
	Dimethyl sulfide (methyl sulfide) - VOC	7.8	62.13		
	Ethane	890	30.07		
	Ethanol - VOC	27	46.08		

Pollutant Parameters (Continued)

		Gas / Pollutant Default Parameters:		*User-specified Pollutant Parameters:*	
	Compound	Concentration (*ppmv*)	Molecular Weight	Concentration (*ppmv*)	Molecular Weight
Pollutants	Ethyl mercaptan (ethanethiol) - VOC	2.3	62.13		
	Ethylbenzene - HAP/VOC	4.6	106.16		
	Ethylene dibromide - HAP/VOC	1.0E-03	187.88		
	Fluorotrichloromethane - VOC	0.76	137.38		
	Hexane - HAP/VOC	6.6	86.18		
	Hydrogen sulfide	36	34.08		
	Mercury (total) - HAP	2.9E-04	200.61		
	Methyl ethyl ketone - HAP/VOC	7.1	72.11		
	Methyl isobutyl ketone - HAP/VOC	1.9	100.16		
	Methyl mercaptan - VOC	2.5	48.11		
	Pentane - VOC	3.3	72.15		
	Perchloroethylene (tetrachloroethylene) - HAP	3.7	165.83		
	Propane - VOC	11	44.09		
	t-1,2-Dichloroethene - VOC	2.8	96.94		
	Toluene - No or Unknown Co-disposal - HAP/VOC	39	92.13		
	Toluene - Co-disposal - HAP/VOC	170	92.13		
	Trichloroethylene (trichloroethene) - HAP/VOC	2.8	131.40		
	Vinyl chloride - HAP/VOC	7.3	62.50		
	Xylenes - HAP/VOC	12	106.16

Summary Report

Landfill Name or Identifier: MSW CB Landfill Model

Date: Monday, May 10, 2021

Description/Comments:

About LandGEM:

First-Order Decomposition Rate Equation:

$$Q_{CH_4} = \sum_{i=1}^{n} \sum_{j=0.1}^{1} kL_o \left(\frac{M_i}{10} \right) e^{-kt_{ij}}$$

Where,

Q_{CH4} = annual methane generation in the year of the calculation ($m^3/year$)

i = 1-year time increment

n = (year of the calculation) - (initial year of waste acceptance)

j = 0.1-year time increment

k = methane generation rate ($year^{-1}$)

L_o = potential methane generation capacity (m^3/Mg)

M_i = mass of waste accepted in the i^{th} year (Mg)

t_{ij} = age of the j^{th} section of waste mass M_i accepted in the i^{th} year (*decimal years*, e.g., 3.2 years)

LandGEM is based on a first-order decomposition rate equation for quantifying emissions from the decomposition of landfilled waste in municipal solid waste (MSW) landfills. The software provides a relatively simple approach to estimating landfill gas emissions. Model defaults are based on empirical data from U.S. landfills. Field test data can also be used in place of model defaults when available. Further guidance on EPA test methods, Clean Air Act (CAA) regulations, and other guidance regarding landfill gas emissions and control technology requirements can be found at http://www.epa.gov/ttnatw01/landfill/landflpg.html.

LandGEM is considered a screening tool — the better the input data, the better the estimates. Often, there are limitations with the available data regarding waste quantity and composition, variation in design and operating practices over time, and changes occurring over time that impact the emissions potential. Changes to landfill operation, such as operating under wet conditions through leachate recirculation or other liquid additions, will result in generating more gas at a faster rate. Defaults for estimating emissions for this type of operation are being developed to include in LandGEM along with defaults for convential landfills (no leachate or liquid additions) for developing emission inventories and determining CAA applicability. Refer to the Web site identified above for future updates.

Input Review

LANDFILL CHARACTERISTICS

Landfill Open Year	**1978**	
Landfill Closure Year (with 80-year limit)	**2045**	
Actual Closure Year (without limit)	***2045***	
Have Model Calculate Closure Year?	**No**	
Waste Design Capacity		*megagrams*

MODEL PARAMETERS

Methane Generation Rate, k	**0.040**	*year^{-1}*
Potential Methane Generation Capacity, L_o	**110**	*m^3/Mg*
NMOC Concentration	**600**	*ppmv as hexane*
Methane Content	**50**	*% by volume*

GASES / POLLUTANTS SELECTED

Gas / Pollutant #1:	**Total landfill gas**
Gas / Pollutant #2:	**Methane**
Gas / Pollutant #3:	**Carbon dioxide**
Gas / Pollutant #4:	**NMOC**

Pollutant Parameters

		Gas / Pollutant Default Parameters:		*User-specified Pollutant Parameters:*	
	Compound	Concentration (*ppmv*)	Molecular Weight	Concentration (*ppmv*)	Molecular Weight
Gases	Total landfill gas		0.00		
	Methane		16.04		
	Carbon dioxide		44.01		
	NMOC	4,000	86.18		
Pollutants	1,1,1-Trichloroethane (methyl chloroform) - HAP	0.48	133.41		
	1,1,2,2-Tetrachloroethane - HAP/VOC	1.1	167.85		
	1,1-Dichloroethane (ethylidene dichloride) - HAP/VOC	2.4	98.97		
	1,1-Dichloroethene (vinylidene chloride) - HAP/VOC	0.20	96.94		
	1,2-Dichloroethane (ethylene dichloride) - HAP/VOC	0.41	98.96		
	1,2-Dichloropropane (propylene dichloride) - HAP/VOC	0.18	112.99		
	2-Propanol (isopropyl alcohol) - VOC	50	60.11		
	Acetone	7.0	58.08		
	Acrylonitrile - HAP/VOC	6.3	53.06		
	Benzene - No or Unknown Co-disposal - HAP/VOC	1.9	78.11		
	Benzene - Co-disposal - HAP/VOC	11	78.11		
	Bromodichloromethane - VOC	3.1	163.83		
	Butane - VOC	5.0	58.12		
	Carbon disulfide - HAP/VOC	0.58	76.13		
	Carbon monoxide	140	28.01		
	Carbon tetrachloride - HAP/VOC	4.0E-03	153.84		
	Carbonyl sulfide - HAP/VOC	0.49	60.07		
	Chlorobenzene - HAP/VOC	0.25	112.56		
	Chlorodifluoromethane	1.3	86.47		
	Chloroethane (ethyl chloride) - HAP/VOC	1.3	64.52		
	Chloroform - HAP/VOC	0.03	119.39		
	Chloromethane - VOC	1.2	50.49		
	Dichlorobenzene - (HAP for para isomer/VOC)	0.21	147		
	Dichlorodifluoromethane	16	120.91		
	Dichlorofluoromethane - VOC	2.6	102.92		
	Dichloromethane (methylene chloride) - HAP	14	84.94		
	Dimethyl sulfide (methyl sulfide) - VOC	7.8	62.13		
	Ethane	890	30.07		
	Ethanol - VOC	27	46.08		

Pollutant Parameters (Continued)

		Gas / Pollutant Default Parameters:		*User-specified Pollutant Parameters:*	
	Compound	Concentration (*ppmv*)	Molecular Weight	Concentration (*ppmv*)	Molecular Weight
Pollutants	Ethyl mercaptan (ethanethiol) - VOC	2.3	62.13		
	Ethylbenzene - HAP/VOC	4.6	106.16		
	Ethylene dibromide - HAP/VOC	1.0E-03	187.88		
	Fluorotrichloromethane - VOC	0.76	137.38		
	Hexane - HAP/VOC	6.6	86.18		
	Hydrogen sulfide	36	34.08		
	Mercury (total) - HAP	2.9E-04	200.61		
	Methyl ethyl ketone - HAP/VOC	7.1	72.11		
	Methyl isobutyl ketone - HAP/VOC	1.9	100.16		
	Methyl mercaptan - VOC	2.5	48.11		
	Pentane - VOC	3.3	72.15		
	Perchloroethylene (tetrachloroethylene) - HAP	3.7	165.83		
	Propane - VOC	11	44.09		
	t-1,2-Dichloroethene - VOC	2.8	96.94		
	Toluene - No or Unknown Co-disposal - HAP/VOC	39	92.13		
	Toluene - Co-disposal - HAP/VOC	170	92.13		
	Trichloroethylene (trichloroethene) - HAP/VOC	2.8	131.40		
	Vinyl chloride - HAP/VOC	7.3	62.50		
	Xylenes - HAP/VOC	12	106.16

Coffin Butte 2021 Gas Generation Model

Assumptions and Notes

1) Waste composition from 2020 to end of model based on historical and current waste composition.
   - **MSW**: 70.5%, **C&D:** 3%, **Inert:** 15.5%, **Organics**: 3%, **Special:** 8%
2) Collection efficiency was calculated using historical collection data and the model's projected generation
3) Waste categories have the L_0 and k values listed in the "Gas Production by Waste Type" tab.
4) Waste acceptance in 2021 to end of of model will be 800,000 tons, as suggested by Republic
5) Flare data was provided by Republic from SCSe tools.

Year	Waste Accepted (tons)	Flare Data (Normalized to 50% Methane) (av ft^3/min)	Overall Gas Generated (Combined Models) (av ft^3/min)	Collection Efficiency (%)	75% Collection Efficiency (%)
1978	75000		0.00		0.00

CALCULATIONS

2021 MASTER PLAN
COFFIN BUTTE LANDFILL
CORVALLIS, OR

DRAWING NO.
M2.04

PROJECT NO.
014.524

LFG Header Pressure Loss Calculations

1. Input data into green text cells
2. LFG 'Rule of Thumb': Fluid Velocity < ~3,500 ft/min

3. Gases and Vapors General 'Rule of Thumb': Fluid Velocity < 15-30 m/s

4. Gases and Vapors General 'Rule of Thumb': kPa/m < 0.02 percent of line pressure

Fittings are not incorperated in this program

Equations Used:
Darcy-Weisbach
Colebrook-White

Assumptions
Standard Conditions
Temperature: 68
Relative Humidity: 0%
Barometric Pressure: 14.7 psi
Viscosity based off 50%CH4 + 50%CO2.
Density:

SCFM is assumed with Standard Conditions

Segment A - 21

Site Conditions	
System Vacuum (in WC)	50
Fluid Temp (F)	100
Fluid Relative Humidity (%)	100%
Local Barometric Pressure (psi)	14.7

add equations Darcy, colebrook-white
refereance conditions
SCFM defined at 68, 0%, 14.7 psi
add "no fittings"
Verify density
add "viscosity 50%50%"

Appendix D: Radius of Influence Calculations

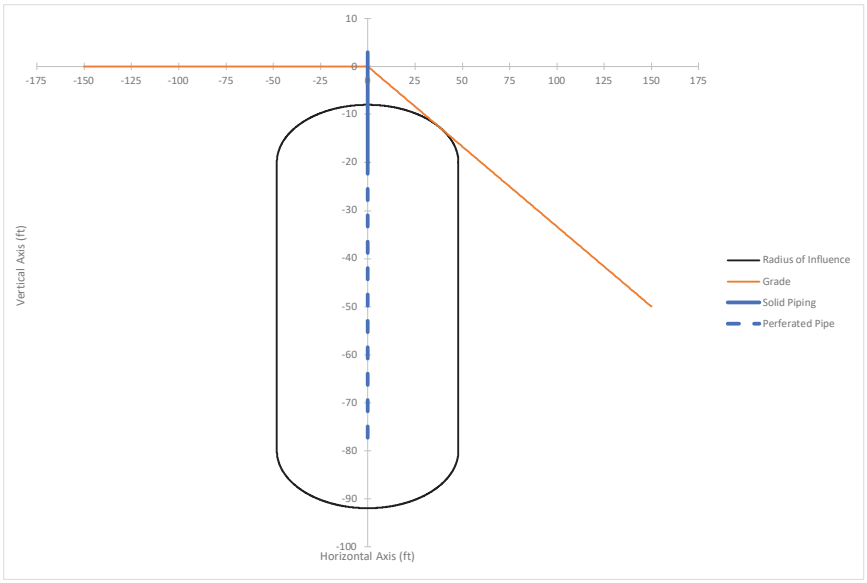
ESI Radius of Influence Calculator

Site: Coffin Butte Landfill
Location: Corvallis, Oregon
Project: 2021 GCCS Design Plan

How to use program:
1. Input length of solid pipe. (Min 20 feet)
2. Select a Permeability Ratio.
3. Select the type of grade if near a slope, or flat surface.
4. Selete type of Landfill Conditions, or Select "User Input" if the conditions are known.
Assumptions:
-Verticle Well located at the edge of slope (if a slope is used).
-The location of the pressure is a foot away from the center of the pipe and assuming. the edge of the ROI is zero. Pressure at well head would need to be slightly higher than the one calculated.

The drawing on the right will automatically update as inputs are calculated. This gives a basic visual representation of what is happening inside of the landfill.

Pipe Conditions		
Length of Solid Pipe (ft)	20	MIN. 20 ft
Length of Perferated Pipe (ft)	60	
Permeability Ratio	4:1 (Average)	
Slope of Grade	3:1 (Typical)	
Landfill Conditions		
Waste Type	Higher Density	Values based on Selected Waste Type
G_M (User Input Only) (ft^3/lb·yr)		G_M 0.1
ρ_w (User Input Only) (lb/yd^3)		ρ_w 2000
K (User Input Only) (cm/sec)		K 0.0005
Max Radius of Influence		
Max Radius of Influence (ft)	48.0	
Vacuum Pressure Needed to obtain ROI		
Vacuum Pressure (in WC)	-0.72	



Definitions:
G_M = LFG generation rate per unit mass
ρ_w = Waste Density
K = Horizontal or radial landfill permeability with respect to LFG
If user is unsure about these values or conditions of the landfill, use the typical value where needed.
Equation Used:

$$\Delta\Psi = \frac{1}{3}\frac{G_M \rho_w}{K}\left(R_l^2 \ln R_l - \frac{1}{2} R_l^2 + \frac{1}{2}\right)$$

R_l = Radius of Influence
$\Delta\Psi$ = Vacuum Headed

APPENDIX G: ALTERNATIVE OPERATION AND MONITORING PLAN (AOMP)

E ALTERNATIVES TO THE NSPS

> **§60.752(b)(2)(i)(B)** The collection and control system design plan shall include any alternatives to the operational standards, test methods, procedures, compliance measures, monitoring, record keeping or reporting provisions of §60.753 through §60.758 proposed by the owner or operator.

Per 40 CFR §60.752(b)(2)(i)(B), the design plan includes proposed alternatives to the operational standards, test methods, procedures, compliance measures, monitoring, recordkeeping, and reporting provisions of §60.753 through §60.758 of the NSPS. This section addresses exemptions/alternatives proposed in this submittal. All of these alternatives are acceptable to and have previously been approved by the USEPA for municipal solid waste landfills in areas of the United States.

E.1 Exclude Steep Slopes and Dangerous Areas from Surface Scan Monitoring Requirements

> **§60.753(d) Operational Standards:** "A surface monitoring design plan shall be developed that includes a topographical map with the monitoring route and the rationale for any site-specific deviations from the thirty meter intervals. Areas with steep slopes or other dangerous areas may be excluded from the surface testing."

The Coffin Butte Landfill is proposing to widen the spacing between intervals from 30-meters to 60-meters in areas that have a geomembrane final cover system placed. The geomembrane cover is expected to provide an excellent barrier to surface emissions, to be demonstrated by routine surface emissions monitoring conducted at the facility. The facility proposes to demonstrate this to the Oregon Department of Environmental Quality (ODEQ) by conducting surface scans initially using a 30-meter spacing. Upon demonstration that the geomembrane-covered areas are compliant for three consecutive quarters, the facility petitions to widen the spacing to 60-meters in these areas.

The facility also proposes to exclude dangerous areas such as roads, the active fill area, truck traffic areas, construction areas, areas with snow or ice cover, and slopes steeper than or equal to 5:1 from surface testing.

E.2 Determination of Oxygen Levels at LFG Monitoring Points

> **§60.753(c)(2) Operational Standards:** "Unless an alternative test method is established as allowed by § 60.752(b)(2)(i) of this subpart, the oxygen shall be determined by an oxygen meter using Method 3A or 3C..."

When applicable, the Coffin Butte Landfill is proposing to use an on-site multi-gas analyzer, in lieu of a laboratory method, for determining the oxygen content of the

landfill gas at each well and monitoring point. The site will be using a portable meter, such as a Landtec GEM-500 or equivalent, calibrated to the manufacturer's specifications, to determine the oxygen content of the gas.

E.3 Operation of Passive Wells Installed in Areas Outside of Condition 13.4

Coffin Butte Landfill requested alternative operation of the passive wells installed in areas outside of condition 13.4, Oregon Title V Operation Permit number 02-9502. This request was approved in June 9, 2006 by ODEQ. The attached request letter and approval letter can be found following this appendix.

E.4 Surface Emissions Monitoring Correction Variance

> *§60.755(c)(4): "Any reading of 500 ppm or more...shall be recorded as a monitored exceedance...cover maintenance or adjustments to the vacuum....shall be made and the location shall be remonitored within 10 calendar days after detecting the exceedance..."*

Coffin Butte Landfill is proposing for the Landfill that a variance to the 10 day window be allotted for adjustments to the cover and/or collection system. Industry experience with facilities suggests that this 10 day time frame is not reasonable to effect comprehensive repairs during all quarters of a typical year. For example, if the Landfill experiences a precipitation event following a surface scan, it may take several days or even weeks for the side slopes of the landfill to dry out enough to support construction equipment for cover repairs. If the side slopes are not sufficiently dry, the repair equipment can cause more damage to the cover (and subsequently higher emissions) than the original erosion or crack.

Poor weather conditions can prevent cover maintenance, leading the follow-up rescans 10 days later to automatically fail. This can ultimately force the installation of an unneeded extraction well, when all that was really required was enough time to make a cover repair.

Coffin Butte Landfill is therefore requesting that the 10 day rescan time frame be extended by an additional two weeks, in the event of adverse weather conditions after a quarterly surface scan (should it be determined that the cover was the cause of the failing reading). Coffin Butte Landfill is proposing to receive this two week extension automatically, upon providing written notification to the ODEQ that the extra time is needed due to adverse weather conditions. Coffin Butte Landfill will place the notification letter in the NSPS files, along with a summary of the adverse weather conditions or other condition creating the need for additional time.

E.5 Monitoring and New/Extended Extraction Wells

> *§60.756: "Except as provided in §60.752(b)(2)(i)(B),*
> *(a) Each owner or operator seeking to comply with §60.752(b)(2)(ii)(A) for an*

active gas collection system shall install a sampling port and a thermometer or other temperature measuring device at each wellhead and:

(1) Measure the gauge pressure in the gas collection header on a monthly basis as provided in §60.755(a)(3); and
(2) Monitor nitrogen or oxygen concentration in the landfill gas on a monthly basis as provided in §60.755(a)(5); and
(3) Monitor temperature of the landfill gas on a monthly basis as provided in §60.755(a)(5)."

New vertical LFG extraction wells are often placed in the active area of the landfill several years before the waste has reached final grades. This is in compliance with the NSPS. However, since the wells are placed in active areas, they periodically need to be "raised" (i.e., the well casing extended 15 to 25 feet vertically) in order to not be buried under later lifts of waste. When they are raised, the HDPE lateral line which provides the applied vacuum is temporarily disconnected until the surrounding lift of trash is brought high enough to reconnect the well. The time frame between when a well is disconnected and raised, and when the waste height is high enough to reconnect the lateral, can often range from a few weeks to a few months. This can result in missed monthly readings at the well, since the well casing is too high for the technician to safely reach.

Since the NSPS allows for exclusion of surface monitoring in "dangerous areas" of the site, Coffin Butte Landfill believes it is reasonable to request exclusion to monitoring the wells raised in active areas. The facility proposes that readings will be missed at a particular well as long as the well cannot be safely accessed. If the facility cannot bring the waste height up to the new grade and re-attach the well within a reasonable amount of time (4 months), then modifications to the lateral/wellhead, such as lowering the wellhead monitoring equipment, will be made for monitoring purposes. This request is in accordance with §60.752(b)(2)(i)(B), which allows the facility to propose alternatives to the monitoring procedures in the NSPS.

E.6 Start-Up of New Wells or Collection System

§60.755(a)(4) does not require the landfill to expand the well field due to positive pressure within the first 180 days of system operation. During the first 180 days of collection and control system operations, where oxygen and/or temperature exceedances are monitored, Coffin Butte Landfill proposes to apply all applicable corrective measures to achieve the operating standards with the following exception: expansion of the collection system to address the exceedances within 120 days. In addition, for new individual wells installed at the Landfill, Coffin Butte Landfill proposes to not expand the well field during the first 180 days of operation for any individual well in which pressure, temperature and/ or either oxygen exceedances are monitored.

E.7 Monitoring of New or Replacement Extraction Wells

GCCSs are typically built in phases to accommodate for sequential waste placement as well as to replace various wells from time to time due to damage from settlement, etc. Installation of only a few additional wells can cause challenges with balancing the entire GCCS and therefore additional time may be needed to not only achieve negative pressure in all wells but to also maintain the operating standard for oxygen and/or temperature.

Per §60.755(a)(4), Coffin Butte Landfill is not required to expand the system during the first 180 days after GCCS start-up where pressure exceedances were recorded at one or more wells. SWANA recommends that, given the well field balancing challenges, USEPA should clarify that the exemption from system expansion applies to any individual well or series of wells associated with the new well(s) upon start-up.

USEPA Response: *Request approval for alternative timeline procedure as part of the Design Plan or amendment to the Design Plan.*

Pursuant to this response from the USEPA, Coffin Butte Landfill proposes to bring new and replacement wells into compliance within 180 days of installation. During this time period, the extraction wells will be monitored, however they will not be subject to the operational and monitoring constraints under §60.753.

E.8 Monitoring of Interim LFG Collectors

SWANA has requested clarification from the USEPA as to whether additional wells or collectors, voluntarily established by the landfill operator, but not specified by the Gas Collection and Control System (GCCS) Design Plan, are subject to NSPS Operational Requirements.

This issue frequently arises when "extra" collectors are added or the leachate collection system is connected to the GCCS to control odors, to increase the quantity of LFG available for beneficial use, or to meet other landfill operating needs beyond regulatory compliance with the rule. Since a professional engineer certified that the GCCS Design Plan would meet the required level of LFG control without the use of the "extra" collectors and the Administrator approved the Design Plan, SWANA does not believe that the operating requirements should be beyond that required by the NSPS rule. Further, because these devices are installed for purposes other than to meet the requirements of the NSPS rule (i.e., odor control, energy recovery projects, etc), their design may preclude their ability to meet the stipulated operation requirements.

An example of this situation is when the leachate collection system is connected to the GCCS for odor mitigation purposes. Because the leachate collection layer extends close to the landfill surface and during initial cell development portions may even be exposed directly to air, a large amount of air can be drawn directly through the leachate system causing elevated oxygen concentrations at the wellhead. In this situation it is often impossible to limit the oxygen concentration to less than the regulatory standard of 5 percent. This, however, does not cause an operational problem as the air never moves through the waste and therefore does not increase the risk of a subsurface fire.

Another example is when LFG is collected from the leachate collection system and the leachate level rises above the perforated portion of the leachate collection riser pipe. In this situation, LFG does not move through the riser and an unrepresentative but elevated oxygen concentration can be measured if a small quantity of air accidentally enters the top of the riser.

Yet a third example is where a landfill owner or operator decides to install and operate wells in areas not yet required to have collection (i.e., initial waste placed is less than 5 years old in active fill area). There is no obligation to collect the LFG and therefore, there should be no monitoring requirements for these wells until the age of the initial waste requires such operation.

Although the NSPS rules may allow for regulatory approval of alternative oxygen standards to resolve some of theses issues, regulatory agencies have been extremely reluctant to grant such alternatives due to unfamiliarity with LFG control technology. A simpler solution would be to clarify in guidance that additional voluntary wells on collectors may be excluded from the performance standards used for wells to establish NSPS compliance.

USEPA Response: *If the collectors are located in an area of the landfill not yet required to have control (i.e., initial waste in place is not yet 2 years in closed or final grade area or 5 years old in active areas) then the monitoring and operational requirements would not apply. If however, the collectors are located in areas of the landfill which require gas control, then the collectors must be monitored and achieve operating limits for pressure, oxygen and temperature. Alternative monitoring procedures and/or operating parameters for these collectors may be requested as part of the Design Plan or addendum to the Design Plan.*

Pursuant to this response from the USEPA, Coffin Butte Landfill proposes that all GCCS connections to leachate management structures or to interim LFG collectors located in an area of the landfill not yet required to have control (i.e., initial waste in place is not yet 2 years old in closed or final grade area or 5 years old in active areas) be excluded from the NSPS operating and monitoring requirements at the Landfill.

E.9 Decommissioning LFG Collectors

Filling around LFG wells may lead to numerous vertical extensions of the vertical LFG collectors. With differential settlement that may occur with time, some vertical LFG wells may fail and cease to provide significant LFG flow. In this situation, LFG does not move through the LFG wellhead and an unrepresentative but elevated oxygen concentration can be measured if a small quantity of air accidentally enters the top of the LFG wellhead. As wells are documented to provide little or no LFG flow, the vertical wells will be decommissioned. Decommissioned wells will be documented in the site records and the semi-annual reports. No additional approval or documentation will be required to decommission wells. No future LFG wellhead monitoring will be conducted on decommissioned LFG wells. Should surface emissions or other NSPS requirements

warrant, replacement wells will be added in accordance with the NSPS to replace decommissioned wells.

The following steps will be taken when a well is decommissioned:

- Close valves;
- Disconnection of well from collection system (removal of flex hose, capping of header lateral, etc.);
- Once disconnected, monthly wellhead monitoring will not be performed on the well; and
- Physical abandonment (i.e., cut off wellhead below ground, cap and backfill). Physical abandonment may not be performed immediately following well disconnection. Timing of the physical abandonment of the well will depend on weather and landfill operating conditions or the potential for the well to recover sufficient LFG flows.

A decommissioned well may be reconnected to the system at a later date if LFG flows recover. This may be possible where a pinched well casing later shears allowing the now open pipe to extract LFG from the surrounding gravel pack. At this time monthly wellhead monitoring will be resumed.

E.10 Additional Alternatives

Coffin Butte Landfill may request additional Alternatives to the NSPS from the USEPA under a site-specific determination request. Alternatives that are subsequently approved by the USEPA will be submitted to the ODEQ as an amendment to this GCCS Design Plan.

RE: AQ-Valley Landfills
Title V Permit 02-9502
Benton County
Operation of Passive Landfill Gas Wells

Dear Mr. Moore:

The Department has received and reviewed your letter of 6/7/06 regarding operation of the passive landfill gas wells at the Valley Landfills, Coffin Butte Landfill. The Department agrees with your assessment that these passive gas wells do not need to be operated in accordance with the requirements in permit conditions 13.8 and 13.9. Because these passive gas wells are not required under condition 13.4 of the permit, they do not have to meet the New Source Performance Subpart WWW requirements.

The Department commends Valley Landfills for its ongoing efforts to reduce odorous emissions from the landfill by installing gas collection systems well in advance of any rule requirements.

If you have any questions regarding this approval, please do not hesitate to call me at 503/378-8240, ext. 234.

Sincerely,

Gary Andes
Natural Resource Specialist

RE: REQUEST FOR APPROVAL OF CHANGE IN OPERATION OF PASSIVE WELLS INSTALLED IN AREAS OUTSIDE CONDITION 13.4, OREGON TITLE V OPERATING PERMIT NUMBER 02-9502 COFFIN BUTTE LANDFILL HIGHWAY 99 AND COFFIN BUTTE ROAD, CORVALLIS, OREGON FARALLON PN: 845-002

Dear Mr. Andes:

On behalf of Valley Landfills, Inc. (VLI), Farallon Consulting, L.L.C. (Farallon) is writing to request approval of special operation of landfill gas wells located outside the areas prescribed by Condition 13.4 of Title V Operating Permit Number 02-9502 for the Coffin Butte Landfill in Corvallis, Oregon, last updated October 27, 2004 (Operating Permit). The requested change applies to certain surface and near-surface horizontal landfill gas (LFG) collection wells and pertains to the following issues:

- Operating the LFG control system with negative pressure at each well-head;
- Maintaining nitrogen concentrations in the LFG to less than 20 percent at the well-head; and
- Maintaining oxygen concentrations in the LFG to less than 5 percent at the well-head.

The basis for the requested change is provided below. The requested change does not include a request for an increase in allowable emission rates for any pollutants. Rather, the requested change actually would result in collection of a greater amount of generated LFG.

VLI is attempting to prevent emission of LFG that could potentially cause problematic odors from all areas of the Coffin Butte Landfill. Initial steps to accomplish this goal included more aggressive installation of vertical LFG collection wells in 2003, and installation of deep horizontal LFG collection pipe wells in 2005. The deep horizontal perforated pipes are installed before additional lifts of solid waste are placed, and only the connector pipes extend to the new landfill surface.

VLI personnel frequently monitor the landfill surface for odors to assess whether additional collection facilities are needed. The monitoring conducted by VLI includes the portions of the landfill where LFG collection wells are not yet required by the Operating Permit, as specified in

Permit Condition 13.4. In some cases, in areas where LFG collection wells are not required by Permit Condition 13.4, VLI would like to install passive LFG collection wells where monitoring has determined that one or more of the following limiting conditions make standard LFG well installations impractical:

- The solid waste depth is too shallow to install vertical LFG collection wells;
- Vertical LFG wells would be buried by additional solid waste layers within 6 months; and
- Deep horizontal LFG collection pipes cannot be installed because overlaying solid waste has already been placed.

In locations outside the areas where LFG wells are required by Permit Condition 13.4 and where one or more of these limiting conditions exist, VLI is installing near-surface horizontal LFG collection perforated pipes in shallow trenches or on the surface of the landfill to collect LFG and to control odors. These collection pipes either will be surrounded by gravel and covered with soil, or will be covered with a temporary membrane cap. VLI refers to these near-surface LFG collection wells as "passive wells." The basic purpose of the passive wells is to collect LFG emissions and control odors in areas where control using other means is not practical.

The operation of passive wells will exhibit a very large LFG flow response to applied vacuum because the soil or a temporary membrane cap seal over the perforated collector pipes will be only partially effective. It will be impossible to develop any significant vacuum in the passive wells because of this weak seal. In addition, the passive wells do not create a vacuum within the underlying solid waste. Even a small applied vacuum in a passive well will draw a large flow, and has the potential to quickly draw excessive air into the collection pipe. Therefore, only a very mild vacuum, enough to produce adequate flow to collect LFG emissions from the landfill surface, would be applied to the passive wells. The mild vacuum applied typically will not be strong enough to be measured using standard LFG monitoring equipment.

Properly designed and maintained passive wells will not operate within some of the parameters required under the Operating Permit. Specifically, the following Operating Permit conditions would not be achievable for proper operation of the passive wells:

- Operating Permit Condition 13.8: "Operate the LFG control system with negative pressure at each well-head."

  The intent of Condition 13.8 is to ensure that adequate LFG control system vacuum is available at every well-head, and that no LFG pressure builds up within the well in the solid waste. Vacuums at other landfills often are considered adequate with at least 10 inches of water column. The Coffin Butte LFG control system has an unusually strong vacuum of 35 inches of water column available throughout the well field; therefore, the adequacy of available vacuum is not in question. The passive wells are installed at or very near the top of the solid waste; therefore, properly designed and maintained passive wells will exhibit little, if any, vacuum, which may not be measurable.

APPENDIX H: COMPLIANCE REVIEW TABLE

Compliance Summary of Landfill Gas Collection and Control System Design Plan

Regulatory Citation	Report Section References	Report Appendix References	Regulatory Requirement	Implementation Summary
OAR 340-239-0110(1)(a)	N/A		If a gas collection and control system which meets the requirements of section (2) of this rule has not been installed, the owner or operator of a landfill must submit a Design Plan to DEQ within one year of becoming subject to this rule.	The GCCS at CBLF is an existing system that now is subject to this rule.
OAR 340-239-0110(1)(b)	1.1		If an owner or operator of a landfill is modifying an existing gas collection and control system to meet the requirements of this division, the owner or operator must submit an amended Design Plan to DEQ that includes any necessary updates or addenda, in accordance with OAR 340-239-0700(3)(j).	This amended design plan was submittied to DEQ within one year of CBLF becoming subject to this rule.
OAR 340-239-0110(1)(c)(A)	1.3 & 4	A	The Design Plan must be prepared and certified by a professional engineer. The following issues must be addressed in the design: Depths of solid waste, solid waste gas generation rates and flow characteristics, cover properties, gas system expandability, leachate and condensate management, accessibility, compatibility with filling operations, integration with closure end use, air intrusion control, corrosion resistance, fill settlement, resistance to the solid waste decomposition heat, and ability to isolate individual components or sections for repair or troubleshooting without shutting down entire collection system.	This plan was prepared and certified by a registered Professional Engineer licensed in the state of Oregon. The design considerations in Section 4 of this plan address all requirements liste din this rule.
OAR 340-239-0110(1)(c)(B)	3, 4, 5, 6	A, B, C, D, E, F, G	The Design Plan must provide for the control of the collected gas through the use of a gas collection and control system meeting the requirements of OAR 340-239-0110(2) or an alternative method approved pursuant to OAR 340-239-0500.	The design plan meets all requirements pursuant to OAR 340-239-0110(2). The Alternative monitoring and operation plan in Appendix G is in pursuant of OAR 340-239-0500.
OAR 340-239-0110(1)(c)(D)	6.4	G	The Design Plan must include any proposed alternatives to the requirements, justification for the need for any proposed alternatives, test methods, procedures, compliance measures, monitoring, and recordkeeping or reporting requirements pursuant to OAR 340-239-0500.	The exisiting AOMP plan was approved by DEQ in 2006.
OAR 340-239-0110(1)(c)(E)	6.2		The Design Plan must include a description of potential mitigation measures to be used to prevent the release of methane or other pollutants into the atmosphere during the installation or preparation of wells, piping, or other equipment; during repairs or the temporary shutdown of gas collection system components; or, when solid waste is to be excavated and moved.	CQA and operations follow the guidelines detailed in Section 6.2 of this plan.
OAR 340-239-0110(1)(c)(F)	6.3	A	For active landfills, the design plan must identify areas of the landfill that are closed or inactive.	There are currently no inactive areas at CBLF. Closed areas are detailed on drawing M1.00

OAR 340-239-0110(1)(c)(G)	5, 6.1	A, B, C, F	The gas collection and control system must be designed to collect gas at an extraction rate to comply with the surface methane emission limits in OAR 340-239-0200, component leak standard in OAR 340-239-0600(2)(c), and be sufficient to meet all operational and performance standards in this division. The expected gas generation flow rate from the landfill must be calculated pursuant to OAR 340-239-0800(5).	The GCCS is sized to accommodate the maximum gas generation projected in the LandGEM. New protocols for SEM monitoring and leak standards are detailed in Section 6.1
OAR 340-239-0110(1)(c)(I)	4.8, 4.13.5, 4.13.6, 5.4, 6.1, 6.2	B, C, D, G	The gas collection and control system must be designed to maintain a negative pressure at all wellheads in the collection system without causing air infiltration, including any wellheads connected to the system as a result of expansion or excess surface emissions	LFG piping is sized to maintain at least 30" W.C. at maximum projected LFG generation. ROIs and perforations of wells are calculated and sized to mitigate air intrustion.
OAR 340-239-0110(1)(c)(H)	6.3	A	Any areas of the landfill that contain only asbestos-containing waste, or nondecomposable solid waste may be excluded from collection provided that the owner or operator submits documentation to DEQ containing the nature of the waste, date of deposition, location and amount of asbestos or non-decomposable solid waste deposited in the area. This documentation may be included as part of the Design Plan.	Asbestos areas are detailed in GCCS layout drawings. Republic tracks waste composition at scale house and deposits asbestos-containing waste within designated areas only.
OAR 340-239-0110(1)(c)(J)	3.1, 3.2, 3.3, 4.13.5, 4.14.1	A, D	The density of wells, horizontal collectors, surface collectors, or other gas extraction devices necessary to achieve compliance with section (2) of this rule.	Wells and collectors are placed according to ROI to ensure proper coverage of active areas.
OAR 340-239-0110(1)(d)	2.2, 2.3	A	The owner or operator of an active landfill must install and operate a gas collection and control system not later than 18 months after the date that the landfill is required to comply with this rule.	CBLF has an active GCCS system and currently meets all requirements with the expection of control devices that meet the requirements of OAR 340-239-0110(2)(c)(b). Republic is planning on fullfilling this requirement via the installation of new control devices prior to the 1/1/24 deadline.
OAR 340-239-0110(1)(e)	N/A	N/A	The owner or operator of a closed or inactive landfill must install and operate a gas collection and control system not later than 30 months after the date that the landfill is required to comply with this rule.	CBLF currently operates an active GCCS.
OAR 340-239-0110(1)(f)	4.4	A	The owner or operator of a controlled landfill must place each well or design component as specified in the approved Design Plan. Following initial construction, each new component must be installed no later than 60 days after the date on which the area controlled by the well is required to be controlled pursuant to this division.	All wells and design components are installed as specified in this design plan. New components are installed within 60 days of an area becoming controlled.
OAR 340-239-0110(1)(g)	2.1, 6		The owner or operator of a landfill must operate, maintain and expand the gas collection system in accordance with the procedures and schedules in the approved Design Plan.	Republic currently operates the landfill according to this design plan.
OAR 340-239-0110(2)(a)(A)	2.3	A	Route all collected gas to a gas control device or devices, and operate the gas collection and control system continuously except as provided in sections (4) and (5) of this rule.	All collected LFG will continue to be continuously diverted to the PNCG plant and/or the exisiting destruction devices except in the case of emergency shutdowns or required maintenance and expansions.

OAR 340-239-0110(2)(a)(C)	2.3	A	Design and operate the gas collection system to draw all the gas toward the gas control device or devices.	All collected LFG will continue to be continuously diverted to the PNCG plant and/or the exisiting destruction devices.
OAR 340-239-0110(2)(a)(D)	4.3, 4.14.1, 4.14.3, 6.1, 6.2	A, F	Design and operate the gas collection system to minimize off-site and on-site migration of subsurface gas in compliance with OAR chapter 340, divisions 093, 094, and 095.	The GGC is designed to provide LFG collection to all controlled areas. Surface emission testing is used to verify that the system is functioning as intended.
OAR 340-239-0110(2)(a)(E)	2.3		In the event the collection or control system is inoperable, the gas mover system shall be shut down and all valves in the collection and control system contributing to venting of the gas to the atmosphere shall be closed within one hour of the collection or control system not operating.	If the flame is not detected at the flare, power is cut to the LFG blowers and the LFG inlet valve closes immediatley.
OAR 340-239-0110(2)(a)(F)	4.12, 6.6, 6.7		Efforts to repair the collection or control system must be initiated and completed in a manner such that downtime is kept to a minimum, and the collection and control system must be returned to operation.	Republic currently operates the GCCS according to minimize system downtime, operating the GCCS in sections if necessary to minimize total system shutdowns.
OAR 340-239-0110(2)(a)(G)	4.5	A	Install all passive collection systems with liners on the bottom and all sides in all areas in which gas is to be collected. The liners must be installed as required under 40 C.F.R. § 258.40.	The current leachate control system is designed according to Subtitle D standards, which fullfill 40 C.F.R. § 258.40.
OAR 340-239-0110(2)(a)(H)	6.3	A	Any area of the landfill may be excluded from control, provided that the total of all excluded areas can be shown to contribute less than one percent (1%) of the total amount of methane emissions from the landfill. The amount, location, and age of the material must be documented and provided to DEQ. If data on actual amounts and age is not available, the landfill owner or operator must estimate based on known information and provide all documentation used to make the estimates. A separate methane emissions estimate must be made for each section proposed for exclusion, and the sum of all such sections must be compared to the methane emissions estimate for the entire landfill, and all calculations, data and documentation used to perform the calculations must be submitted to DEQ. The methane emissions from each section proposed for exclusion must be computed using the methods provided in OAR 340-239-0800(5).	CBLF currenlty has no inactive areas. Any future areas will be submitted for approval by DEQ as per OAR 340-239-0800(5) .
OAR 340-239-0110(2)(a)(I)	4.13, 5.1, 5.3	A, D	The landfill gas extraction components must be constructed of polyvinyl chloride (PVC), high density polyethylene (HDPE) pipe, fiberglass, stainless steel, or other nonporous corrosion resistant material of suitable dimensions to: Convey projected amounts of gases; withstand installation, static, and settlement forces; and withstand planned overburden or traffic loads. The collection system must extend as necessary to comply with emission and migration standards. Collection devices such as wells and horizontal collectors must be perforated to allow gas entry without head loss sufficient to impair performance across the intended extent of control. Perforations must be situated with regard to the need to prevent excessive air infiltration.	Republic currently follows these sections of the design plan. Perforations are calculated and designed in such a way to minimize air infiltration.

OAR 340-239-0110(2)(a)(J)	3.1, 3.2, 3.3.1, 4.14	A, D	Vertical wells must be placed so as not to endanger underlying liners and must address the occurrence of water within the landfill. Holes and trenches constructed for piped wells and horizontal collectors must be of sufficient cross-section so as to allow for their proper construction and completion including, for example, centering of pipes and placement of gravel backfill. Collection devices must be designed so as not to allow indirect short circuiting of air into the cover, into the solid waste, into the collection system, or gas into the air. Any gravel used around pipe perforations should be of a dimension so as not to penetrate or block perforations.	Republic currently operates according to these rules. Fullfillment of each item is found in section 4.14 and its subsections.
OAR 340-239-0110(2)(a)(K)	3.4, 4.15	A	Collection devices may be connected to the collection header pipes below or above the landfill surface. The connector assembly must include a positive closing throttle valve, any necessary seals and couplings, access couplings and at least one sampling port. The collection devices must be constructed of PVC, HDPE, fiberglass, stainless steel, or other nonporous material of suitable thickness.	Republic currently implements this approach in their GCCS design.
OAR 340-239-0110(2)(a)(L)(i)	4.2, 5.2	B	For existing collection systems, the flow data must be used to project the maximum flow rate. If no flow data exists, the procedures in subparagraph (2)(a)(L)(ii) of this rule must be used	The design engineer uses flow data from the PNCG facility flowmeters at the generation plant and flares to compare to modeled projections generated by the EPA LandGEM.
OAR 340-239-0110(2)(a)(L)(ii)	N/A	N/A	For new collection systems, the maximum flow rate must be determined in accordance with OAR 340-239-0800(5).	CBLF has an existing GCCS.
OAR 340-239-0110(2)(b)	N/A	N/A	Requirements for Enclosed Flares. A landfill owner or operator who operates an enclosed flare must route the collected gas to an enclosed flare that meets all of the following requirements:	CBLF does not currently have enclosed flares.
OAR 340-239-0110(2)(c)	2.3		Requirements for open flares: A landfill owner or operator who operates an open flare must route the collected gas to an open flare that meets the requirements of 40 C.F.R. § 60.18.	CBLF has two open flares, both of which comply with 40 C.F.R. § 60.18.
OAR 340-239-0110(2)(c)(A)	2.3		(A) Install, calibrate, maintain, and operate the following equipment according to the manufacturer's specifications: (i) A heat sensing device, such as an ultraviolet beam sensor or thermocouple, at the pilot light or the flame itself to indicate the continuous presence of a flame; and (ii) A device that records flow to the flare and bypass of the flare (if applicable). The owner or operator must: (I) Install, calibrate, and maintain a gas flow rate measuring device that records the flow to the control device at least every 15 minutes; and (II) Secure the bypass line valve in the closed position with a car-seal or a lock-and-key type configuration. A visual inspection of the seal or closure mechanism must be performed at least once every month to ensure that the valve is maintained in the closed position and that the gas flow is not diverted through the bypass line.	The existing flares have thermocouples, flowmeters, and UV flame detectors that operate continuously. Flowmeters are calibrated in accordance to manufactuer's specifications. A visual inspection of all mechanisms is performed monthly. There are no bypass lines around the control devices.

OAR 340-239-0110(2)(c)(B)	2.3		An open flare installed and operating prior to August 1, 2021, may operate until January 1, 2024, but is thereafter prohibited except as provided in paragraph (2)(c)(C) of this rule.	Both flares operating at CBLF were installed prior to 8/1/2021. They will be replaced by control devices that meet DEQ requirements before 1/1/24.
OAR 340-239-0110(2)(c)(C)	2.3		Operation of an open flare on or after January 1, 2024, is only allowed with DEQ's written approval, which DEQ will determine based on whether the owner or operator demonstrates to the satisfaction of DEQ that one of the following conditions apply: (i) The methane generation rate is less than 664 metric tons per year pursuant to OAR 340-239-800(2) and is insufficient to support the continuous operation of an enclosed flare or other gas control device; (ii) The owner or operator is seeking to temporarily operate an open flare during the repair or maintenance of the gas control system, or while awaiting the installation of an enclosed flare, or to address offsite gas migration issues. An owner seeking to temporarily operate an open flare under this subparagraph must submit a written request to DEQ pursuant to OAR 340-239-0500; (iii) The owner or operator has landfill gas emissions that are unable to be controlled using enclosed flare gas control devices in the gas control system. These emissions being controlled using an open flare may not exceed 664 metric tons (732 tons) per year of methane. An owner seeking to operate an open flare under this subparagraph must submit a written request to DEQ pursuant to OAR 340-239-0500. The request must include an analysis verifying that there is no feasible alternative control device configuration that would use the landfill gas emissions without use of an open flare; or (iv) The owner or operator otherwise has received written approval from DEQ to operate an open flare pursuant to OAR 340-239-0500.	Republic will replace the exisiting flares with control devices that meet these requirements prior to the 1/1/24 deadline.
OAR 340-239-0110(2)(d)(B)(i)	2.3		(B) Route the collected gas to an energy recovery device, or series of devices that meets all of the following requirements: (i) Achieves a methane destruction efficiency of at least 99 percent by weight pursuant to OAR 340-239-0800(6). Lean burn internal combustion engines must reduce the outlet methane concentration to less than 3,000 ppmv, dry basis, corrected to 15 percent oxygen.	CBLF diverts a majority of LFG generated to the PNCG power facility which uses lean burn internal combustion engines that meet these requirements. All remaining LFg is combusted by the flares.
OAR 340-239-0110(2)(d)(B)(ii)	2.3		For new gas control devices, the destruction efficiency or parts per million by volume required according to OAR 340-239-0110(2)(d)(A)(i) must be established by an initial performance test to be completed no later than 180 days after the initial startup of the approved control system using the test methods specified in OAR 340-239-0800(6) and the DEQ Source Test Manual.	New control equipment will be selected based off on manufactuer's specifications and emission reduction guarantees. Performance testing will be performed following the commissioning phase of new control devices using methods in the DEQ Source Test Manual within 180 days of startup.
OAR 340-239-0110(2)(d)(B)(iii)	2.3		Existing gas control devices must demonstrate compliance with this rule not later than 180 days from the effective date of this rule using the performance test methods specified in OAR 340-239-0800(6) and the DEQ Source Test Manual.	The current flares have a methane destruction effiency of 98 percent. They are to be replaced by new control devices that meet these requirements.

OAR 340-239-0110(2)(d)(B)(iv)	2.3		Operate the gas control device within the parameter ranges established during the initial or most recent performance test that demonstrates compliance with the standard in OAR 340-239- 0110(2)(d)(A)(i). Until a performance test is performed, operate the gas control device within engineering or manufacturer's established parameter ranges.	All control devices are currently operated according to this rule.
OAR 340-239-0110(2)(d)(C)	N/A	N/A	Route the collected gas to a treatment system that processes the collected gas for subsequent sale or use. Venting of treated landfill gas to the ambient air is not allowed. If the treated landfill gas cannot be routed for subsequent sale or beneficial use, then the treated landfill gas must be controlled according to either subsection (2)(b), (2)(c) or (2)(d) of this rule. All emissions vented to the atmosphere from the gas treatment system are subject to the requirements of subsection (2)(b) or (2)(c) of this rule. The owner or operator must prepare a site-specific treatment monitoring plan to include all of the following: (i) Monitoring records of parameters that are identified in the treatment system monitoring plan and that ensure the treatment system is operating properly for each intended end use of the treated landfill gas. At a minimum, records must include records of filtration, de-watering, and compression parameters. 14 (ii) Monitoring methods, frequencies, and operating ranges for each monitored operating parameter based on manufacturer's recommendations or engineering analysis for each intended end use of the treated landfill gas. (iii) Documentation of the monitoring methods and ranges, along with justification for their use. (iv) List of responsible staff (by name and job title) for data collection. (v) Processes and methods used to collect the necessary data. (vi) Description of the procedures and methods that are used for quality assurance, maintenance, and repair of all continuous monitoring systems (CMS).	CBLF does not ultilize a gas treatment system. All LFG collected is diverted to the PNGC facility and/or the flares.

OAR 340-239-0110(2)(d)(e)	N/A	N/A	The owner or operator complying with section (2)(d) of this rule by using a landfill gas treatment system must calibrate, maintain, and operate according to the manufacturer's specifications a device that records flow to the treatment system and bypass of the treatment system (if applicable). The owner or operator must maintain and operate all monitoring systems associated with the treatment system in accordance with the site-specific treatment system monitoring plan required by paragraph (2)(d)(C) of this rule. The owner or operator must: (A) Install, calibrate, and maintain a gas flow rate measuring device that records the flow to the treatment system at least every 15 minutes; (B) Install liners or equivalent non-permeable materials on the bottom and all sides in all areas in which gas is to be collected. The liners must be installed as required under 40 C.F.R. 258.40; and (C) Secure the bypass line valve in the closed position with a car-seal or a lock-and-key type configuration. A visual inspection of the seal or closure mechanism must be performed at least once every month to ensure that the valve is maintained in the closed position and that the gas flow is not diverted through the bypass line.	CBLF does not ultilize a gas treatment system. All LFG collected is diverted to the PNGC facility and/or the flares.
OAR 340-239-0110(2)(d)(f)	2.3		Performance Test Requirements. The owner or operator must conduct annual performance tests for any gas control device(s) subject to the requirements of section (2) of this rule using the test methods identified in OAR 340-239-0800(6). Following an initial performance test, the owner or operator must conduct a complete annual performance test each calendar year, no later than 45 days after the anniversary date of the initial performance test. Performance tests must be conducted in compliance with all of the following requirements:	Annual performance testing is performed on all destruction devices annually. The current flares in operation do not meet the 99 percent methane destruction efficiency. New destruction devices that do meet these requirements will be installed and operational prior to the 1/1/24 deadline.
OAR 340-239-0110(3)	3.4, 6.5, 6.7	A	Wellhead sampling. A landfill owner or operator required to comply with section (2) of this rule for an active gas collection system must install a sampling port and measuring devices, or an access port for measuring devices, at each wellhead and comply with the following, using measuring devices that meet the requirements of OAR 340-239-0800(7):(a) Monitor nitrogen or oxygen concentration in the landfill gas on a monthly basis as provided in OAR 340-239-0600(3); (b) Monitor temperature of the landfill gas on a monthly basis as provided in OAR 340-239-0600(3); and (c) Measure the gauge pressure in the gas collection header on a monthly basis as provided in OAR 340-239-0600(2)(d).	All active wellheads have 3 sampling ports, a temperature port, and integrated flow devices. These ports allow for temperature, oxygen, nitrogen, methane, gauge pressure and flow to be monitored and recorded. Current operations monitor each wellhead at minimum once monthly.

OAR 340-239-0110(3)	6.6		Well Raising. The requirements of paragraph (2)(a)(A), paragraph (2)(a)(B), and section (3) of this rule do not apply to individual wells involved in well raising provided the following conditions are met: (a) New fill is being added or compacted in the immediate vicinity around the well; and (b) Once installed, a gas collection well extension is sealed or capped until the raised well is reconnected to a vacuum source.	Republic currently operates under this rule.
OAR 340-239-0110(4)	6.2.1, 6.2.2		Repairs and Temporary Shutdown of Gas Collection System Components: The requirements of paragraphs (2)(a)(A) and (2)(a)(B) do not apply to individual landfill gas collection system components that must be temporarily shut down in order to repair the components due to emergencies, catastrophic events such as earthquakes, to extinguish landfill fires, to prevent landfill fires, to connect new landfill gas collection system components to the existing system, to perform construction activities pursuant to OAR 340-239-0300, or to conduct performance testing, provided the following requirements are met: 16 (a) Any new gas collection system components required to maintain compliance with this division must be included in the most recent Design Plan pursuant to section (1) of this rule. The owner or operator must comply with applicable provisions of the Notice of Construction requirements in OAR chapter 340, division 210 and permit modification requirements of OAR chapter 340, division 216 or 218 prior to the construction, installation and operation of new landfill gas collection system components; (b) Methane emissions are minimized during shutdown pursuant to paragraph (1)(a)(E) of this rule; and (c) The owner or operator must submit a notification to DEQ after any temporary shutdown due to an emergency, catastrophic event or landfill fires in accordance with OAR 340-239- 0700(3)(n).	Republic currently operates under this rule.

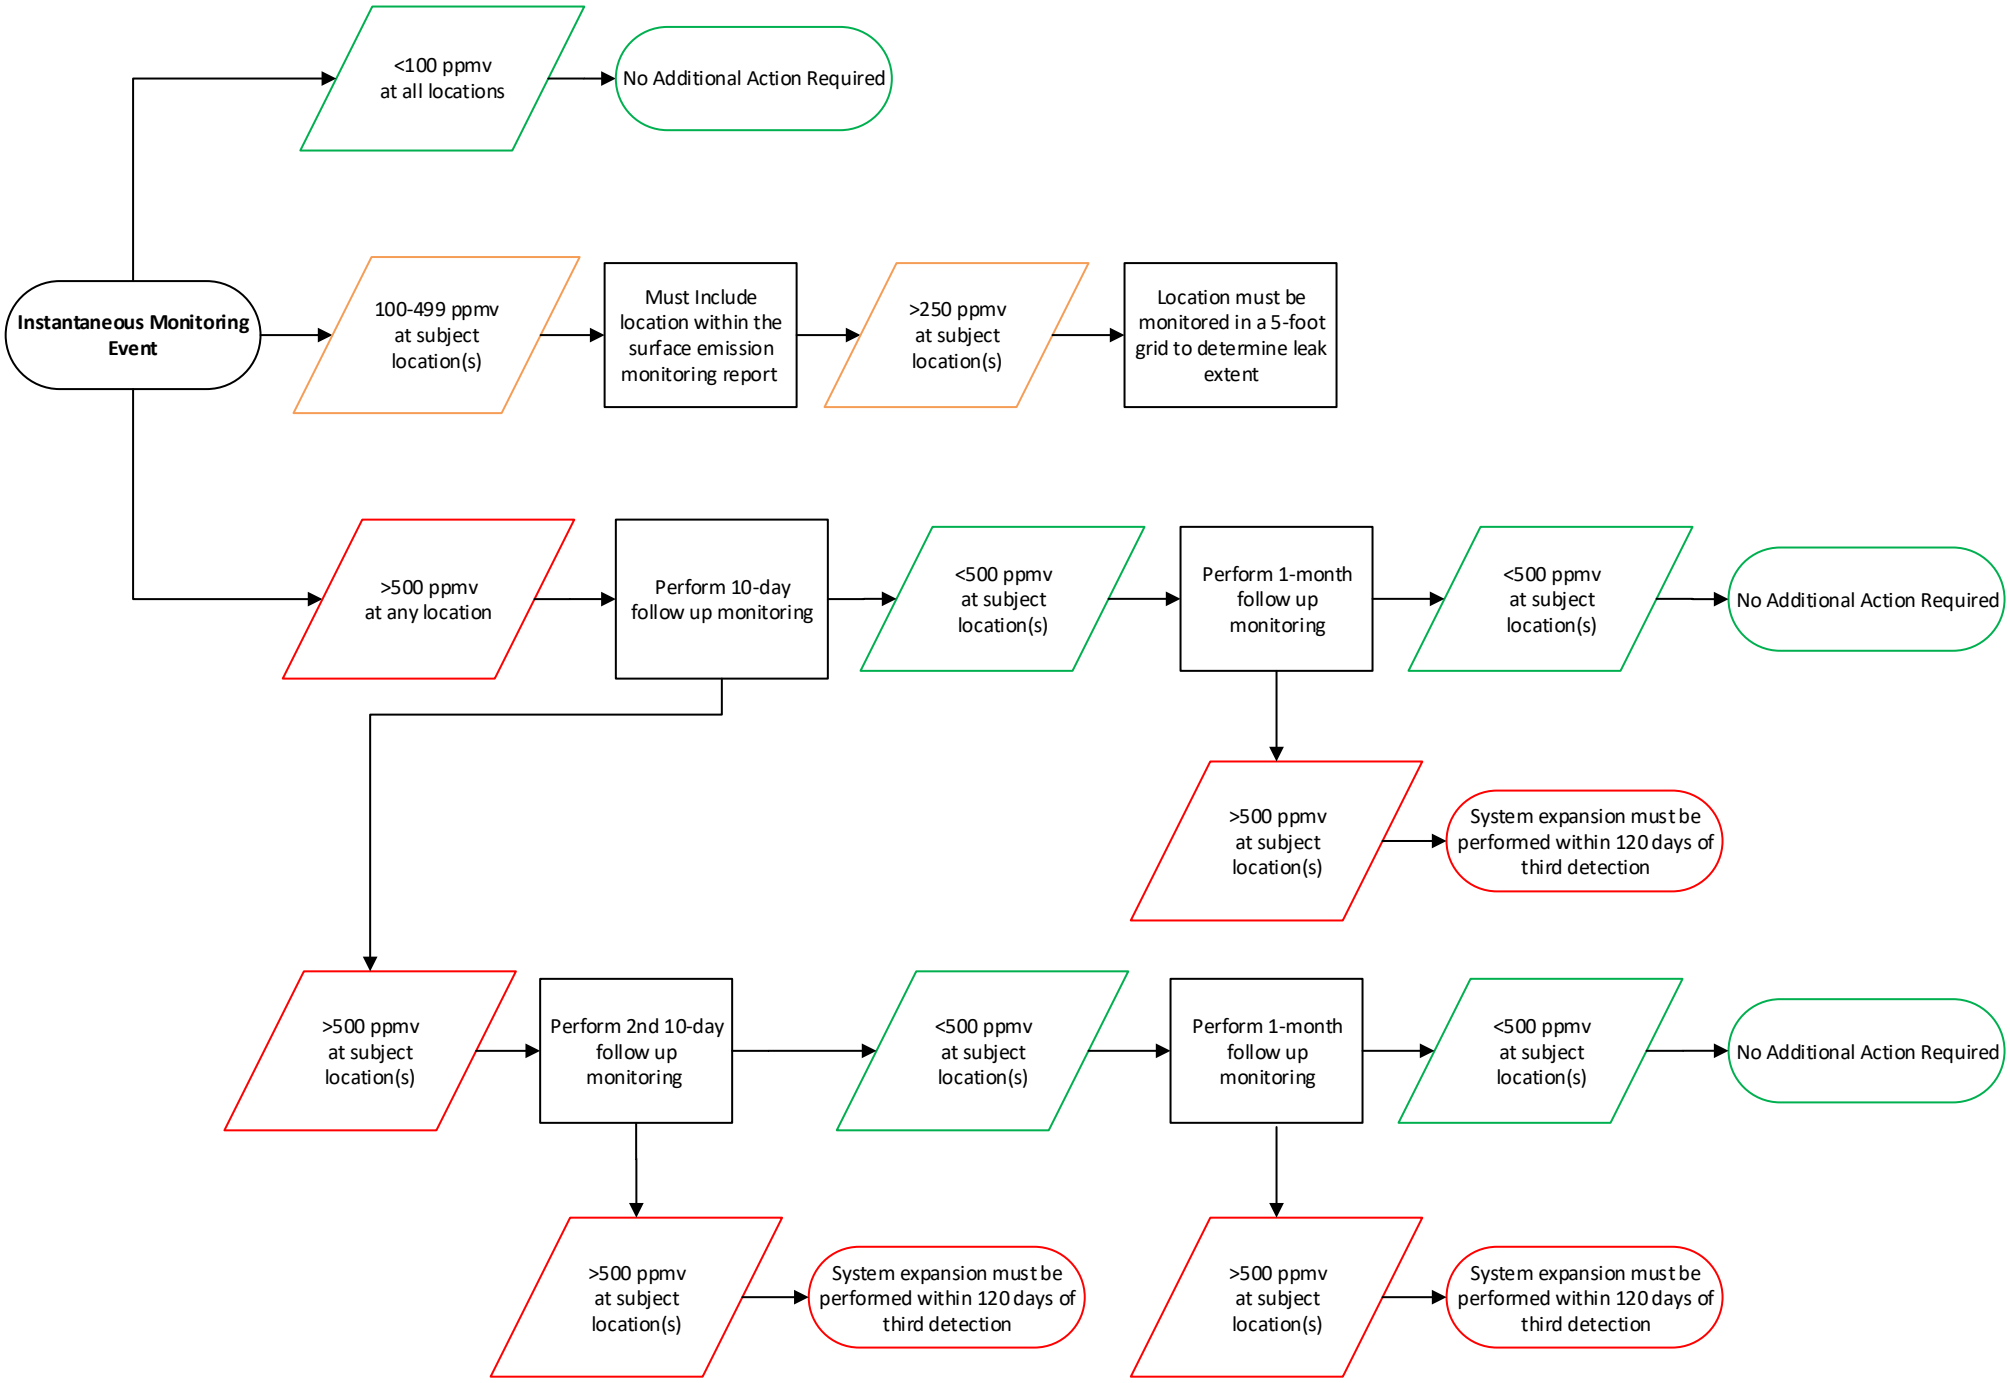
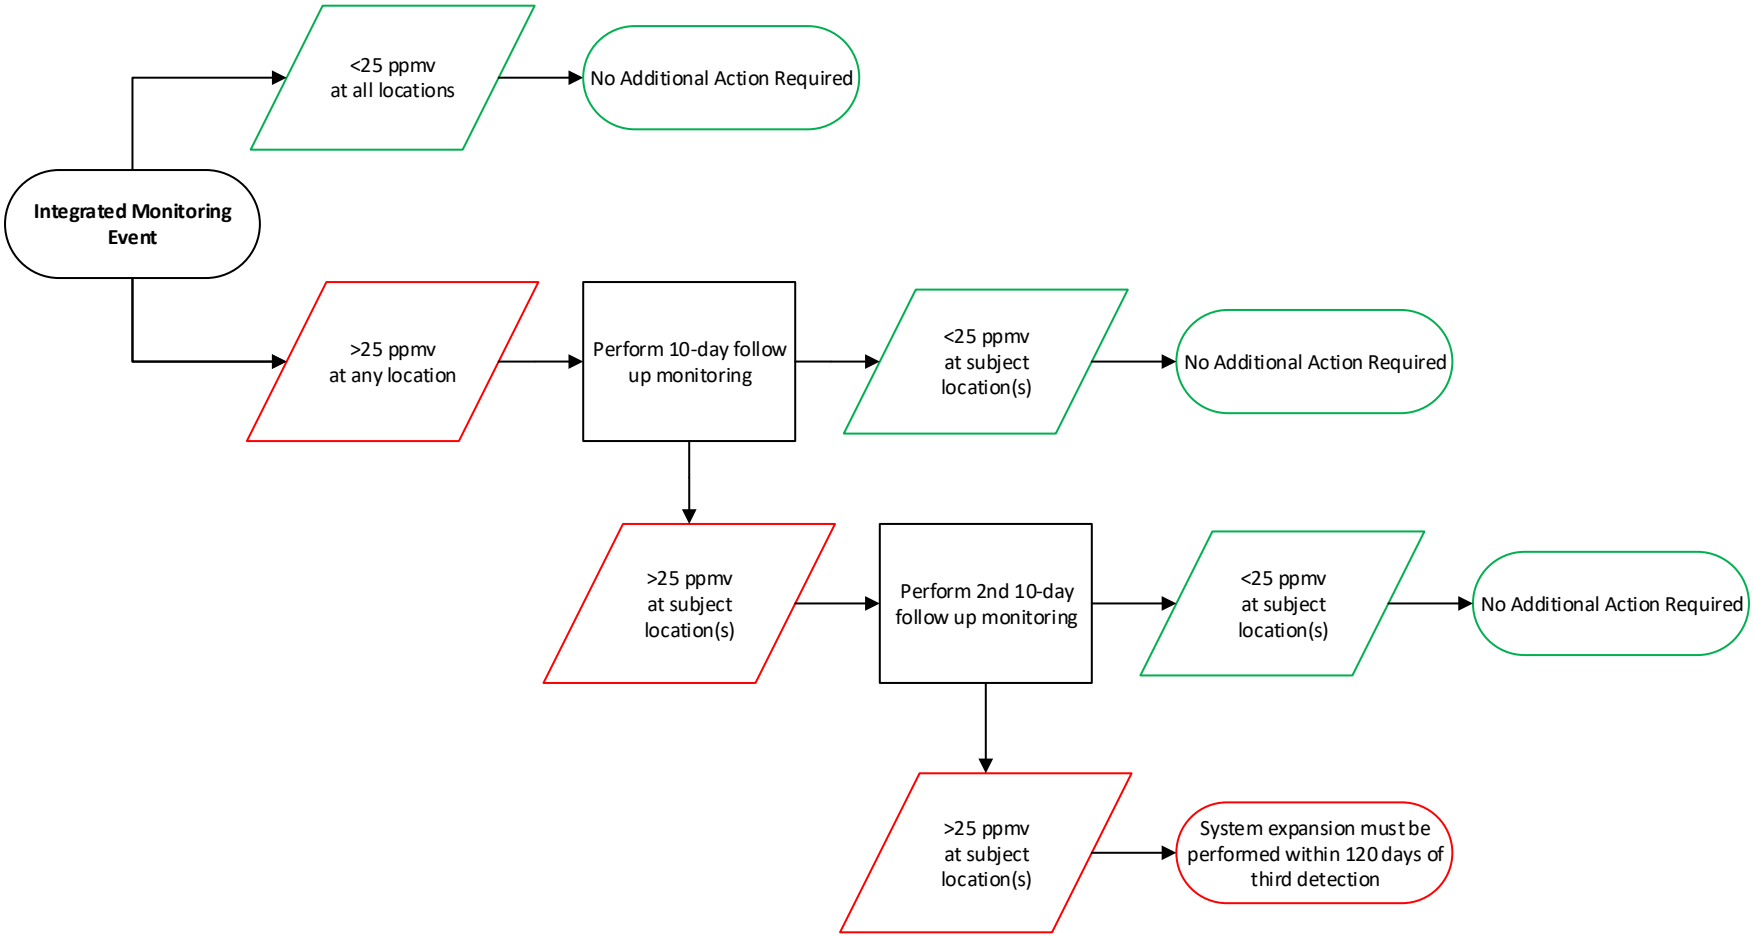
Instantaneous and Integrated Monitoring Flowcharts

Oregon Landfill Gas Instantaneous Monitoring Flowchart



Oregon Landfill Gas Integrated Monitoring Flowchart



APPENDIX E

Table 1 - Instantaneous & Integrated Exceedances - Methane Surface Emissions

	Table 1 - Instantaneous & Integrated Exceedances of - Methane Surface Emissions									
	Instantaneous Exceedances (Number of Individual Readings >500 ppmv)					Integrated Exceedances (Number of Grids with Average Readings >25 ppmv)				Pressurized Piping (>500 ppmv)
Monitoring Period	Initial	1st 10-day Re-Monitoring	2nd 10-day Re-Monitoring	1-Month Re-Monitoring	System Expansion Required (Y/N)	Initial	1st 10-day Re-Monitoring	2nd 10-day Re-Monitoring	System Expansion Required (Y/N)	Initial
Q3 2022*	101	27	0	0	N	19	14	See notes	Y	0
Notes:	No exceedances above 500 ppmv were identified in the 2nd 10-day or the 1-month re-monitoring events following system adjustments and remediation by SCS and site personnel.					SCS-FS notes within their report that a second 10-day re-monitoring event was conducted, but the report only presents results for completing the first 10-day remonitoring event. The gas collection and control system was expanded in November 2022 in the subject area.				NA
Q4 2022*	18	0	NA	NA	N	23	See notes	See notes	Y	0
Notes:	No exceedances above 500 ppmv were identified in the first 10-day re-monitoring following system adjustments and remediation by SCS and site personnel.					SCS-FS notes the required first and second 10-day follow-up monitoring events were unable to be performed due to weather. Based on these monitoring results with accordance with the OMR, (with initial concentrations in exceedance not corrected) the site is required to perform a system expansion within 120-days of the third detected exceedance. The gas collection and control system was expanded in the subject areas in November 2022.				NA
Q1 2023*	6	0	NA	NA	N	15	15	11	Y	0
Notes:	No exceedances above 500 ppmv were identified in the first 10-day re-monitoring following system adjustments and remediation by SCS and site personnel.					Based on these monitoring results with accordance with the OMR, (with initial concentrations in exceedance not corrected) the site is required to perform a system expansion within 120-days of the third detected exceedance. The gas collection and control system was expanded in the subject areas in March 2023.				NA
Q2 2023*	18	14	4	4	Y	19	13	11	Y	0
Notes:	In accordance with requirements for expansion and remediation, the instantaneous locations need to be remediated and returned to compliance in accordance with the rule (expansion of the collection system or an alternative compliance option if approved by the OAR) within 120 days after the third integrated exceedance. The gas collection and control system was expanded in the subject areas in June 2023.					Based on these monitoring results with accordance with the OMR, (with initial concentrations in exceedance not corrected) the site is required to perform a system expansion within 120-days of the third detected exceedance. SCS-FS report appears to have a typographic error where they note only two (2) of the nineteen integrated exceedances were reduced below the 25 ppmv threshhold following completion of the 1st and 2nd 10-day re-monitoring events; however, Table 2 within Attachment 4 provides all measurements and following completion of both monitoring events, eleven (11) integrated monitoring results remain above the 25 ppmv threshhold. The gas collection and control system was expanded in the subject areas in June 2023.				NA
Q3 2023*	1	0	NA	0	N	5	3	3	Y	0
Notes:	No exceedances above 500 ppmv were identified in the first 10-day or the 1-month re-monitoring events following system adjustments and remediation by SCS and site personnel.					Based on these monitoring results with accordance with the OMR, (with initial concentrations in exceedance not corrected) the site is required to perform a system expansion within 120-days of the third detected exceedance. The gas collection and control system was expanded in the subject area in September 2023.				NA
Q4 2023*	5	3	2	2	Y	8	4	1	Y	0
Notes:	In accordance with requirements for expansion and remediation, the instantaneous locations need to be remediated and returned to compliance in accordance with the rule (expansion of the collection system or an alternative compliance option if approved by the OAR) within 120 days after the third integrated exceedance. The gas collection and control system was expanded in the subject areas in March 2024.					Based on these monitoring results with accordance with the OMR, (with initial concentrations in exceedance not corrected) the site is required to perform a system expansion within 120-days of the third detected exceedance. The gas collection and control system was expanded in the subject areas in March 2024.				NA
Q1 2024*	11	9	8	See notes	Y	4	0	NA	N	0
Notes:	need to be remediated and returned to compliance in accordance with the rule (expansion of the collection system or an alternative compliance option if approved by the OAR) within 120 days after the third integrated exceedance. SCS doesn't report results of the 1-month remonitoring event in the subject quarterly report and it's unclear if/why it wasn't conducted. Regardless, the gas collection and control system was expanded in the subject areas in March 2024.					No exceedances above 25 ppmv were identified in the first 10-day re-monitoring event following system adjustments and remediation by SCS and site personnel; therefore, no additional monitoring was required for the quarter.				NA
Q2 2024* EPA conducted initial monitoring event, SCS conducted the re-monitoring events	41	2	1	1	Y	Integrated data not prepared/available for the monitoring performed by the EPA				0
Notes:	In accordance with requirements for expansion and remediation, the instantaneous locations need to be remediated and returned to compliance in accordance with the rule (expansion of the collection system or an alternative compliance option if approved by the OAR) within 120 days after the third integrated exceedance. No system expansion reported during Q2 2024, although system expansions were performed in the last month of Q1 2024 (March) and the last month of Q3 2024 (September).									NA
Q2 2024* SCS monitoring data only	22	15	15	15	Y	3	0	NA	N	0
Notes:	In accordance with requirements for expansion and remediation, the instantaneous locations need to be remediated and returned to compliance in accordance with the rule (expansion of the collection system or an alternative compliance option if approved by the OAR) within 120 days after the third integrated exceedance. No system expansion reported during Q2 2024, although system expansions were performed in the last month of Q1 2024 (March) and the last month of Q3 2024 (September).					No exceedances above 25 ppmv were identified in the first 10-day re-monitoring event following system adjustments and remediation by SCS and site personnel; therefore, no additional monitoring was required for the quarter.				NA

* Quarterly report notes several grids were not monitored, in accordance with the OAR, due to active landfilling activities, unsafe conditions, overgrown vegetation, or no waste in place.

Subject: Roseburg Landfill– Roseburg, Oregon

Surface Emissions Monitoring for the Second Quarter of 2024.

Dear Mr. Nick Frisinger,

SCS Field Services (SCS-FS) is pleased to provide the Douglas County Solid Waste Department with the enclosed report summarizing the surface emissions monitoring services performed by SCS-FS at Roseburg Landfill (Site) during the second quarter of 2024. This report includes the results of the surface scan, component emissions, and blower/flare station emissions monitoring for the Site.

SCS-FS appreciates the opportunity to be of assistance to Roseburg Landfill on this project. As you review the enclosed information, please contact Stephen Harquail at (503) 867-2369 or Max Polkabla at (510) 277-5122 if you have any questions or comments.

Sincerely,

Max Polkabla

Roseburg Landfill

Oregon Landfill Gas Emissions Rule (OAR) and Surface Emissions Monitoring
Second Quarter 2024

INTRODUCTION

This letter provides the results of April 8, 9, 16, and May 8, 2024, OAR landfill surface emissions monitoring (SEM) performed by SCS Field Services (SCS) at the Roseburg Landfill. All work was performed in accordance with our approved Work Scope, and the OAR requirements.

SITE BACKGROUND

Roseburg Landfill began receiving waste in 1932 and was privately owned and operated until 1975. The County purchased the landfill in 1975 and has operated the facility since that time.

From 1932 until the 1960s, Roseburg Landfill was operated as a burning dump. Disposal operations proceeded past the current landfill entrance gate westward up the valley of the Main Fill. Additionally, some ash and unburnt waste disposal occurred in the area now occupied by the Lateral Expansion. In the late 1960s operations changed from burning to conventional waste disposal (e.g., landfilling). Waste disposal operations shifted to the main valley (now called the Main Fill). Between 1997 and 2000, the County constructed the Lateral Expansion that is adjacent to and hydraulically upgradient to cross-gradient of the Main Fill. The Lateral Expansion is approximately 20 acres and is constructed to Subtitle D standards and comprised of three lined cells: Cell 1, Cell 2, and Cell 3. Groundwater drainage systems were constructed beneath the Lateral Expansion that includes the GWC and SDS.

In 2000 and 2001, the County installed seven LFG extraction wells in the Main Fill, just south of the interface with the Lateral Expansion, and a candle stick flare southwest of PV-1. Before waste was placed in the Lateral Expansion, VOCs were detected in discharges from the GWC, SDS, and SLCS. After the LFG collection and control system (GCCS) was installed and operating, VOCs were either no longer detected or only sporadically detected in liquid samples from these locations. A private entity, Roseburg LFG Energy, LLC, operates and maintains the GCCS, which now consists of over 50 LFG extraction wells and a landfill gas-to-energy plant.

2024 State Regulatory Applicability

Roseburg Landfill is subject to the Oregon-specific landfill gas emission regulations in OAR Chapter 340 Division 239. These SEM regulations are detailed below.

SURFACE EMISSION METHANE CONCENTRATION LIMITS

> *340-239-0200 (1) Surface Emission Methane Concentration Limits. Except as provided in OAR 340-239-0110(4), 340-239-0110(5), 340-239-0300, and 340-239-0600(1), beginning August 1, 2022, or upon commencing operation of a newly installed gas collection and control system or modification of an existing gas collection and control system pursuant to OAR 340-239-*

0110(1), whichever is later, no location on the landfill surface may exceed either of the following methane concentration limits:

(a) 500 ppmv, other than nonrepeatable, momentary readings, as determined by instantaneous surface emissions monitoring conducted in accordance with OAR 340-239-0800(3)(b);

(b) An average methane concentration limit of 25 ppmv as determined by integrated surface emissions monitoring conducted in accordance with OAR 340-239-800(3)(c).

The 500 ppmv limit is already a requirement in the Federal (NESHAP) regulations above, but an average methane concentration limit of 25 ppmv will be adhered to as required.

SURFACE EMISSION RECORDKEEPING

340-239-0700(2)(a)(C) All instantaneous surface readings of 100 ppmv methane or greater. All exceedances of the limits in OAR 340-239-0100(6)(b) and 340-239-0200, including the location of the leak (or affected grid), leak concentration in ppmv methane, date and time of measurement, the action taken to repair the leak, date of repair, any required remonitoring and the remonitored concentration in ppmv methane, wind speed during surface sampling, and the installation date and location of each well installed as part of a gas collection system expansion;

In compliance with OAR, all emissions points 100 ppmv or over will be documented. All repeatable instantaneous records of 100 ppm or higher (taken during SEM) must be kept for 5 years AND recorded in the semi-annual reports.

SUMMARY AND CONCLUSIONS

As stipulated in OAR, if uncorrectable exceedances within the 10-day limitation are detected or emissions are discovered during an inspection by Regulatory Agencies, the landfill must perform monitoring on a 25-foot pathway on a quarterly basis for active disposal sites. Upon completion of four consecutive SEM events without an uncorrectable exceedance of the 25 ppmv or 500 ppmv standards, other than non-repeatable momentary readings, the landfill may perform the monitoring on a 100-foot spacing on an annual basis for closed landfills or quarterly for active disposal sites. In accordance with the provisions of the OAR, the monitoring of the Roseburg landfill was done on a 25-foot pathway based on no prior inspections provided.

On April 8, and 9, 2024, SCS performed second quarter 2024 surface emissions monitoring testing as required by the Oregon Landfill Gas Emission Rule. Instantaneous surface emissions monitoring results indicated that twelve (12) locations exceeded the 500 ppmv maximum concentration on the above-mentioned dates (Table 1 in Attachment 3). The required first 10-day (OAR) monitoring indicated that all areas returned to below regulatory compliance limits following system adjustments and remediation by site personnel. Based on these monitoring results no additional follow-up testing was required.

Also, during the instantaneous monitoring event, SCS performed integrated monitoring of the landfill surface. As required by the OAR, the landfill was divided into 50,000 square foot areas. The Douglas County/Roseburg Landfill surface is divided into 54 grids, as shown in Figure 1 in Attachment 1. During this monitoring event, several grids were not monitored, in accordance with the regulations, due to ongoing active landfilling activities, unsafe conditions, or there was no waste in place prior to the monitoring event.

During the monitoring event, there were no areas observed to exceed the 25 ppmv OAR integrated average threshold (Table 2 in Attachment 4). These results are discussed in a subsequent section of this report.

In addition, quarterly monitoring of the pressurized piping or components of the Gas Collection and Control System (GCCS) under positive pressure must be performed quarterly. Results of the testing of the landfill gas (LFG) Blower Flare Station (BFS) pressurized pipe and components indicated that all test locations were in compliance with the 500 ppmv requirements.

Further, as required under the OAR, any location on the landfill that has an observed instantaneous methane concentration above 100 ppmv must be included within the surface emission monitoring report. If any instantaneous location records above 250 ppmv, it must be monitored in a 5-foot grid around the location to determine the extent of the methane leak. During this reporting period, six (6) locations were observed showing elevated concentrations between 100-499 ppmv, of the reporting threshold. When these readings are observed to be repeatable, they are reported to site personnel for tracking and/or remediation and will be reported in the next submittal of the annual OAR report. Finally, to help prevent potential future exceedances, SCS recommends that the landfill surface be routinely inspected and any observed surface erosion be routinely repaired.

SURFACE EMISSIONS MONITORING

On April 8, 9, 16, and May 8, 2024, the instantaneous and integrated SEM was performed over the surface of the subject site. The monitoring intended to identify any specific locations or areas of the landfill surface with organic compound concentrations exceeding the OAR threshold limit values of 500 ppmv measured as methane for instantaneous monitoring, or an average methane concentration of 25 ppmv for the integrated monitoring in the 50,000 square foot grids as required under the OAR. During this event, SCS performed the monitoring on a 25-foot pathway as required.

EMISSIONS TESTING INSTRUMENTATION/CALIBRATION

The instruments used to perform the landfill surface emission testing consisted of the following:

- Thermo Scientific TVA 2020 portable Flame Ionization Detector (FID). This instrument measures methane in the air over a range of 1 to 50,000 ppmv. The TVA 2020 meets the State of California Air Resources Board (CARB) requirements for combined instantaneous and integrated monitoring and was calibrated in accordance with the United States Environmental Protection Agency (US EPA) Method 21.

- Weather Anemometer with continuous recorder for meteorological conditions in accordance with the OAR.

Instrument calibration logs and weather information are shown in Attachments 5 and 6.

SURFACE EMISSIONS MONITORING PROCEDURES

Surface emissions monitoring was conducted in accordance with the OAR and SEM requirements. Monitoring was performed with the FID inlet held within 2 inches of the landfill surface while a technician walked a grid in parallel paths not more than 25 feet apart over the landfill's surface. Cracks, holes, and other cover penetrations in the surface were also tested. Surface emissions readings were monitored continuously and recorded every 5 seconds. Any areas exceeding the 100 or 500 ppmv standards

(reporting and compliance levels, respectively) would be GPS-tagged and stake-marked for on-site personnel to perform remediation or repairs.

The integrated average is based on the readings stored on the instrument, which are recorded every 5 seconds. The readings are then downloaded and the averages are calculated for each grid using SCS eTools®. All readings are maintained in this secure SCS Database. The readings are not provided in the report due to the volume of readings but can be furnished upon request.

Recorded wind speed results are shown in Attachment 6. Wind speed averages were observed to remain below the alternative threshold of 10 miles per hour, and no instantaneous speeds exceeded 20 miles per hour. No rainfall occurred within 72 hours of the monitoring events. Therefore, site meteorological conditions were within the alternatives of the OAR requirements on the above-mentioned dates.

TESTING RESULTS

During this event, SCS performed the monitoring on a 25-foot pathway as required under the OAR. The monitoring intended to identify any specific locations or areas of the landfill surface with organic compound concentrations exceeding the OAR or NSPS threshold limit values of 500 ppmv measured as methane for instantaneous monitoring, or an average methane concentration of 25 ppmv for the integrated monitoring (OAR).

On April 8, and 9, 2024, SCS performed the second quarter of 2024 instantaneous emissions monitoring testing as required by the Oregon DEQ/OAR. During this monitoring, surface emissions results indicated that twelve (12) locations exceeded the 500 ppmv maximum concentration. The required first 10-day (OAR) follow-up monitoring performed on April 16th, 2024, and the 1-month (OAR) follow-up monitoring event performed on May 8, 2024, indicated that all locations returned below compliance limits as required, following system adjustments and remediation by site personnel. Results of the initial and follow-up monitoring are shown in Attachment 3 (Table 1). Calibration logs for the monitoring equipment are provided in Attachment 5. Results of the monitoring are shown in Attachments 2 and 3 (Table 1).

During this monitoring event, several grids were not monitored, in accordance with the OAR, due to active landfilling activities, unsafe conditions, overgrown vegetation, or no waste in place. SCS will continue to monitor all accessible locations during the third quarter of 2024.

PRESSURIZED PIPE AND COMPONENT LEAK MONITORING

On April 9, 2024, quarterly leak monitoring was performed in accordance with the OAR. SCS performed LFG pressurized pipe and component leak monitoring at the BFS. Monitoring was performed with the detector inlet held one-half of an inch from the pressurized pipe and associated components. No locations exceeding the 500 ppmv threshold were observed during our monitoring event. The maximum reading, which was 5.00 ppmv, was well below the maximum threshold (see Table 1 for component results). Therefore, all pressurized pipes and components located at the LFG BFS were in compliance at the time of our testing.

PROJECT SCHEDULE

According to the OAR, surface emissions monitoring at active landfills is required to be performed on a quarterly basis. Therefore, in accordance with our approved Work Scope, the third quarter of 2024 surface emissions testing event is scheduled to be performed by the end of September 2024.

STANDARD PROVISIONS

This report addresses the conditions of the subject site during the testing dates only. Accordingly, we assume no responsibility for any changes that may occur subsequent to our testing which could affect the surface emissions at the subject site or adjacent properties.

Transportation Engineering and Planning Services

Date:	May 23, 2025
To:	Petra Schuetz
From:	Joe Bessman, PE
Project Reference No.:	1539
Project Name:	Coffin Butte Landfill – Open Record

The purpose of this memorandum is to provide a formal response to public comments related to transportation that were received on the Coffin Butte Landfill conditional use application for expansion south of Coffin Butte Road as part of LU-24-027. Comments received from the public hearings are provided below followed by our response.

Comment 1: Traffic from the landfill has increased on Coffin Butte Road.

Response: Transight Consulting has been supporting Valley Landfills with transportation analysis of the Coffin Butte Road for the past five years, with various data collection efforts conducted by Benton County staff and third-party data collection firms throughout this period. In addition to the Coffin Butte Landfill, Coffin Butte Road served the adjacent Knife River Quarry, and connects to other rural uses to the west. Landfill demands constantly fluctuate (seasonally, daily, and even hourly), which is similar to travel demands along Highway 99W and to and from the surrounding rural uses.

The historical data collection conducted on Coffin Butte Road was not collected at landfill entrance, nor was data collection scheduled for the same specific time periods (or the same day of the week or month of the year), but rather to respond to specific Code requirements and issues raised. Throughout this period the data collection at Highway 99W/Coffin Butte Road reflects the most consistent count location throughout this period.

Traffic counts were collected at the Highway 99W/Coffin Butte Road intersection in March 2021, January 2022, September 2023, and April 2025. These traffic counts were specifically intended to capture the weekday evening commute period, which is the time period with the highest overall Total Entering Vehicles typically between the hours of 4:00 p.m. and 6:00 p.m. The January 2021, September 2023, and the April 2025 traffic counts included an extended time period from 2:00 to 6:00 p.m., with this data showing that even with the elevated landfill activity occurring earlier in the day, the peak hour at the highway intersection occurred within the 4:00 to 6:00 p.m. period, confirming that this does reflect the peak “design hour”.

While there are seasonal and day of week fluctuations, in review of the total entering traffic volumes (TEV) these unadjusted traffic counts show a relatively stable travel pattern, with the highest observed volumes in September 2023 and the lowest observed volumes in April 2025 (see Table 1). Increased activity occurred within the adjacent Knife River quarry to accelerate the removal of the material; this activity was captured in the September 2023 counts.

Table 1. Summary of Historical Traffic Counts, Total Entering Vehicles

Location	March 2021 Weekday Traffic Counts	January 2022 Weekday Traffic Counts	September 2023 Weekday Traffic Counts	April 2025 Weekday Traffic Counts
Highway 99W/ Coffin Butte Rd	836 Vehicles *4:35 to 5:35 PM*	820 Vehicles *4:35 to 5:35 PM*	894 Vehicles *4:35 to 5:35 PM*	805 Vehicles *4:00 to 5:00 PM*

Traffic volumes at the Highway 99W/Coffin Butte Road intersection show a fairly stable pattern throughout this time period. All of the traffic counts except the April 2025 data show a peak hour during the 4:35 to 5:35 p.m. period, with the April counts showing an earlier peak between 4:00 and 5:00 p.m. Further review was conducted specifically of eastbound and westbound traffic volumes on the west leg of the intersection from these same counts, with the travel patterns summarized in Table 2. This data consistently reviewed the 4:35 to 5:35 p.m. period to avoid time of day bias in this comparison, and reflects all the traffic arriving at the highway (including quarry trips, landfill trips, and other rural trips).

Table 2. Summary of Historical Traffic Counts on West Approach of Highway 99W/Coffin Butte Rd

Direction	March 2021 Weekday Traffic Counts	January 2022 Weekday Traffic Counts	September 2023 Weekday Traffic Counts	April 2025 Weekday Traffic Counts
Eastbound	38 Vehicles *(4:35 to 5:35 PM)*	19 Vehicles *(4:35 to 5:35 PM)*	49 Vehicles *(4:35 to 5:35 PM)*	33 Vehicles *(4:35 to 5:35 PM)*
Westbound	15 Vehicles *(4:35 to 5:35 PM)*	9 Vehicles *(4:35 to 5:35 PM)*	17 Vehicles *(4:35 to 5:35 PM)*	6 Vehicles *(4:35 to 5:35 PM)*
Bi-Directional Total	53 Vehicles	28 Vehicles	66 Vehicles	39 Vehicles

This data was prepared to reflect the peak traffic volumes on the system, which is the time period commonly referred to as the *System Peak Hour* or *Design Hour*. The April 2025 data collected at the landfill entrance shows that the peak landfill activity occurs earlier in the day, tapering into the evening commute period when the highway volume increases.

This data shows that the critical weekday p.m. peak hour volumes at OR 99W/Coffin Butte Road have been fairly stable over this five-year period, and volumes from Coffin Butte Road during the peak hour have also been relatively consistent. The measured traffic volumes remain within the normal seasonal fluctuation expected for this type of use and do not reflect an increasing trend.

Comment 2: Landfill trucks are heavier than other types of trucks and can accelerate pavement wear and maintenance on Coffin Butte Road.

Response: There are a variety of trucks that enter and exit the Coffin Butte landfill. Review of data captured at the landfill entrance between 7:00 a.m. and 9:00 p.m. show that trucks account for about two-thirds of all the Coffin Butte landfill trips. These truck types range from single-unit box trucks to semi-trucks, but the increased loading does increase pavement wear in comparison to the impact of passenger vehicles.

The modification of circulation and access will add truck trips in the section of Coffin Butte Road between the current landfill entrance and the new expansion entrance; this section of roadway will be

reconstructed to current Benton County standards for a *Collector Road* and a *Freight Route* as addressed within the application. The design of this roadway extension will address the additional truck travel along Coffin Butte Road and the maintenance impacts of these trips.

Comment 3: The removal of the tonnage cap could increase travel to Coffin Butte at a much higher rate than area population growth. The traffic study does not account for programmatic/landfill management changes that could drastically increase travel.

Response: Landfill tonnage is a common metric to associate with landfill trips, but there are multiple factors that influence trip rates at a landfill. Waste management often involves siting transfer stations within close proximity to the population served, so that residential vehicles and contractors can make shorter trips to these facilities. This waste is then hauled by larger transfer trucks to regional facilities like the Coffin Butte landfill. This process of consolidating refuse from multiple individual sources results in a lower number of trips per ton as the haul distance increases. Based on discussions with the Republic Services team, there are no plans to increase the Coffin Butte operations beyond current area population growth.

Within the literature review section of the submitted traffic study we reviewed other landfill applications prepared at other sites across the US. One of these studies was conducted at the Twin Creeks Landfill, and this report was prepared to address a tonnage increase from 750,000 per year to a maximum of 1,400,000 tons. This study found that nearly doubling the tonnage resulted in only +6 weekday p.m. peak hour truck trips, which was due to the dispersion of trips throughout the day, reduced waste transport later into the evening period, and the use of larger trucks to support the longer-distance waste transfer.

The traffic study prepared for Coffin Butte recognizes that landfill trips can vary seasonally, by day of the week, and in response to population growth. While changes due to the tonnage cap were not directly assessed or considered within the February 2024 Transportation Impact Analysis, the traffic study considered the relocation of truck trips between the scales and the new landfill entrance and increased the existing traffic volumes by 50% (+57 additional peak hour trips). This change in travel is well beyond the projected population growth identified for Linn-Benton County that identifies annual growth of about 1% annually, or State of Oregon projections showing a population change of about 1.7% annually. Applying these growth rates would only result in a 10% to 20% increase in traffic volumes throughout the design and construction of the expansion site and its seven-year lifespan.

While a specific tonnage limit was not specifically considered or assessed within the Coffin Butte traffic study, the submitted analysis demonstrates that there is ample capacity on the system to support a higher tonnage limit, particularly if the additional materials were to arrive from other waste transfer stations using larger transfer trucks.

Comment 4: The activity on Coffin Butte Road will be so intense as to effectively "close" the road for public use.

Response: Coffin Butte Road is a low-volume Benton County designated *Collector* Road and *Freight Route.* The traffic volumes have been reviewed over the past five years to establish the current travel levels of the landfill, and to show estimates of activity with the proposed expansion site.

The proposed modifications to the landfill access with the expansion site will not change the current traffic volumes between Highway 99W and the existing landfill entrance, which reflects the highest-volume portion of this corridor (all trucks and passenger vehicles destined to the landfill will continue to use this portion of the road, as well as public trips from rural areas to the west). Within this area, traffic counts

from April 2025 show a peak bi-directional volume east of the landfill entrance between 10:25 a.m. and 11:25 a.m. of about 160 total vehicles on this roadway segment (from the landfill and other public trips). This level of travel is well below the capacity of the facility, and while Benton County does not have specific volume thresholds for its rural Collectors, this value (approximately 1,600 vehicles per day) is about 60% of a typical rural Collector volume range (which is generally between 300 and 2,600 vehicles per day per the Federal Highway Administration's 2023 publication *Highway Functional Classification: Concepts, Criteria, and Procedures*).

NEXT STEPS

Thank you for the opportunity to clarify these transportation materials for the Coffin Butte Landfill, if you have any questions I can be reached at (503) 997-4473 or via email at joe@transightconsulting.com.

Wildlife Memorandum

for Coffin Butte Landfill Expansion Project

For: Benton County Planning Commission

By: Turnstone Environmental Consultants, Inc.

Date: June 2, 2025

INTRODUCTION

This memorandum is to address various Planning Commissioner questions and public comment raised in response to the evidence submitted by Applicant related to wildlife.

Concerns Regarding Roosevelt Elk

- Trail camera surveillance showed that elk use the expansion area as peripheral habitat, which is considered important but not essential habitat. Their primary habitat is to the west in open fields and coastal forest areas.
- Trail cameras found a large herd using the forested area in the expansion site for limited periods (2 to 11 days) and on only three occasions during a 12-month period.

Concerns Regarding Great Blue Herons and Bald Eagles

- Turnstone biologists observed the aftermath of the nest failure event with four juvenile bald eagles visiting each Great Blue Heron nest in the eastern rookery and cannot determine the cause of the nest failure, which would be speculation.
- Eagles and herons co-exist in areas next to open water, such as in the Columbia River Gorge, where there is a known eagle nest occurring within 200 yards of an active Great Blue Heron rookery.
- Two adult eagles and typically one or two young will occupy a nest; whereas, the landfill can attract a high density of eagles. While Bald Eagles and Great Blue Herons can nest in close proximity, the high density of eagles and large flocks of other predatory birds, may pose a different threat to the rookery. It may be possible that a large congregation of Bald Eagles could ascend on a Great Blue Heron rookery and cause a collapse.
- The new location of the eastern Great Blue Heron nest site is farther away from the Coffin Butte Landfill. The Applicant will manage the expansion, if approved, in accordance with the Oregon Forest Practices Act (FPA) and all other applicable regulations.

- The FPA requires landowners to avoid disturbance within 300 feet of an active nest or rookery during the nesting season from February 15 to July 31. Forest operations are restricted within 0.25-mile of active nest trees during the critical nesting period. The new nesting site is greater than 0.25 mile from the proposed tree removal areas.

- Turnstone's opinion remains that the expansion is not posing a serious interference to wildlife in the area.

Sincerely,

Stephanie James

SCS ENGINEERS Environmental Consultants & Contractors

June 5, 2025
File No. 27223197

MEMORANDUM

TO: Republic Services

FROM: James Walsh, P.E., BCEE, SCS Engineers

SUBJECT: Rebuttal to Public Comments Received May 2025
To Benton County Planning & Zoning Commission
On Landfill Fire Potential at Coffin Butte Landfill

From review of public comments provided, both in oral testimony and on the written record, in hearings for the Conditional Use Permit (CUP) on Coffin Butte Landfill, I summarize below 5 significant comments on landfill fire issues that I observed. Those comments and my responses to them are listed below.

1. Adair Fire Department

Comment: There were concerns voiced by an Adair Fire representative that property tax revenue to the Department has not kept up with Fire District growth and Department responsibilities. At the same time, there have been recent reductions in Adair Fire staffing. This may result in difficulties by the Department in meeting fire response needs in the future at Coffin Butte Landfill.

Response: Coffin Butte staff just met with Adair Fire in March 2025. The meeting went well with each party pledging to work together going forward, as well as they have in the past. In the meeting, the parties discussed a few ways both can engage and serve one another even better in the future. Meeting notes by both sides committed each party to continue the good working relationship of the past. There were no concerns expressed at that time about any possible service or support reduction from Adair Fire. Coffin Butte appreciates the past support Adair Fire has provided,and are hopeful it can continue in the future at the same level. With that said, it should be pointed out that most fires at the landfill have been handled properly and in full by landfill staff, and it is believed that will continue to be the case going forward.

2. FEMA Report

Comment: Adair Fire Department reported that they have reviewed a FEMA authored report on Landfill Fires suggesting that such fires can be large, can be fueled by landfill methane emissions, and may strain local fire services.

Response: We are well familiar with the FEMA document cited. FEMA often creates large debris piles from disaster cleanups. Waste in those can be left uncovered for months. Understandably, FEMA has had issues with fires in those large uncovered debris piles. However, FEMA has no operating experience with a modern MSW landfill like Coffin Butte Landfill or its fire potential or reality. Like any modern MSW landfill, Coffin Butte Landfill covers its waste each night and never has large areas of uncovered waste exposed for months at a time. Coffin Butte has far less fire potential than that reported by FEMA. Further, FEMA is simply mis-informed about methane emissions causing or exacerbating landfill fires. Landfill fires have nothing to do with methane emissions, not at Coffin Butte, and not at any modern MSW landfill. None of the past fires at Coffin Butte were created or exacerbated by methane.

3. Reporting Fires at Coffin Butte Landfill

Comment: It was suggested that Coffin Butte compile a running log of landfill fire incidents. And develop Incident Reports for each landfill fire. And that the Landfill's Operations Plan commits it to report each landfill fire event to OR DEQ.

Response: In response to community comments related to being apprised of fire events, Coffin Butte will maintain a log of fire incidents at the Landfill and a Coffin Butte representative will provide a verbal report on fire events at each Benton County Disposal Site Advisory Committee meeting. Further, Coffin Butte will ensure it is reporting each fire event to OR DEQ.

4. Magnitude of Landfill Fire Risks

Comment: One public commenter cited the SCS report as identifying 5 fires at Coffin Butte Landfill from 1999 to 2025 which they suggested was inconsistent with records from Adair Fire that report 28 calls for fire at the Landfill between 2013 and 2025. It was further stated that the SCS report identified 3 types of landfill fires that represent a material risk. There are many additional fire risks beyond those 3. The commenter concluded that the SCS report drastically under-represented the number, types, and magnitude of landfill fire risks.

Response: As the report makes clear, the 5 fires reported were those material and memorable to landfill staff, and representative of each of the 2 kinds of landfill fire that the landfill has experienced to date: working face fires and grass fires. It wasn't intended to identify any and all fires. Further, the landfill is confident there are only 3 types of landfill fires that could pose a material risk at Coffin Butte Landfill. Any others beyond those 3 have never occurred at the landfill, and we do not have a reasonable basis to believe there ever will be. The report fairly represents the number, types, and magnitude of landfill fire risks. Fires at the landfill have been safely and correctly managed to date, and will be so in the future, ensuring no significant impact on the community or environment.

The landfill abides by the state of the practice for landfill fire management like at any other modern MSW landfill. Many will recall the 1999 landfill fire that was significant. That was when the site was owned and operated by the prior operator, not Republic Services. The only way that could have occurred is if many acres of waste were left uncovered and exposed for weeks on end. Republic

covers all waste at the confined daily working face at the end of each working day, with very few exceptions which are quickly addressed. There is no reasonable basis to believe that a fire of that size would reoccur with Republic Services.

5. On-Site Water Truck

Comment: It was reported that the 4,000 gallon water truck on site is defective, does not work, and would offer no value in extinguishing landfill fire.

Response: That statement is completely false. Landfill staff report that the subject water truck has been in continuous service in past years and is fully available at all times to help extinguish fires. In fact, that truck has been employed many times over the years to help extinguish both grass fires and working face fires.

Civil & Environmental Consultants, Inc.

CONSTRUCTION SEQUENCE
June 2025

Civil & Environmental Consultants is providing this general overview of how construction will occur in the expansion area once the Conditional Use Permit is approved. Construction will generally conform to the following sequence, but changes may occur due to variables inherent in most construction projects. This construction sequence is being submitted in response to feedback received during the Condition Use Permit hearing process, prior to finalization of any Conditions of Approval. The construction timeline will adhere to all applicable Conditions of Approval.

- Landscape screening will be installed pursuant to the applicable Condition of Approval.
- The Coffin Butte Road left turn lane construction will be completed as the first part of the construction of the expansion area. A detailed design will be completed and submitted to Benton County for their review and approval prior to any construction commencing.
- The new leachate storage ponds will be constructed first, initially with the landfill staff excavating the soil material and hauling it to the existing landfill for use as daily cover. Blasting will be required during excavation of the leachate storage ponds and blasting will occur between the hours of 12:00 PM and 5:00 PM. However, once subgrade for the leachate storage ponds is achieved, blasting will not be required for the leachate storage ponds.
- Some of the material from the leachate storage pond excavation might be stockpiled on the existing landfill to be used as daily cover, intermediate cover or for road or tipper deck construction.
- Once construction of the leachate storage ponds achieves the required subgrade elevation, the liner installation company will mobilize to the site and install the required liner system and floating cover system.
- All the existing leachate piping that was routing leachate to the existing leachate ponds that is located in the expansion area footprint will be removed. New piping for the leachate will be installed that connects the leachate sumps in the existing landfill to the new leachate ponds.
- Once the new leachate ponds are approved by the Oregon Department of Environmental Quality (ODEQ) then leachate from the existing landfill will be pumped to these new ponds.
- Once the new leachate ponds are active, the existing leachate ponds will be closed in accordance with the closure requirements of the ODEQ.
- The building located within the footprint of the expansion area will be removed.
- The area will be logged, and timber will be removed by a company that specializes in timber removal.
- At this point the landfill staff will start removing soil material from the expansion area and using it as daily cover.

- Currently, the existing landfill has 14.2 million cubic yards of airspace remaining, at 15% for daily cover, the landfill staff will remove approximately 2.2 million cubic yards of material from the expansion area.
- At the appropriate time based on sequencing, Coffin Butte Landfill will hire a Contractor to complete the remaining excavation, which is estimated to be approximately 946,000 cubic yards. Additional blasting will be performed during the excavation of the expansion cell. Again, blasting will be performed between the hours of 12:00 PM and 5:00 PM.
- The Contractor will remove this material, and it will either be used for final cover material or stockpiled on the landfill for use as daily and/or intermediate cover for the expansion area.
- Once the subgrade elevations have been achieved, the liner system installation company will be mobilized to the site to install the liner system.
- The liner system is estimated to be installed in 3 phases over a period of 3 years.
- Once the liner system has been installed and approved by ODEQ, waste placement will commence.

EXPIRES: **06/30/2026**

Civil & Environmental Consultants, Inc.

INFORMATION ON DRY CLIMATE LANDFILLS
June 2025

Civil & Environmental Consultants is providing this summary on dry climate landfills. It has been CEC's experience working with many dry climate landfills, like the ones located in eastern Oregon, that produce the same amount of landfill gas provided they are taking similar tonnage amounts for disposal. For example, if a landfill located in a dry climate takes 1.1M tons, like Coffin Butte, they would produce almost the same amount of landfill gas. The difference being, is that Coffin Butte Landfill, located in wetter climate, will produce the landfill gas faster because of the rainfall, then a landfill in a drier climate.

Furthermore, again based on CEC's experience, dry climate landfills will accept free liquids as part of the US EPA Research, Development and Demonstration (RDD) Permit, which falls under 40 CFR Section 270.65. There is also a guidance manual that is EPA/530-SW-86-008, published in July 1986. This RDD permit allows the landfills in drier climates to accept free liquids and place the liquids into the working face. This allows the waste to be compacted better and allows for faster waste degradation allowing for the increased landfill gas generation.

Once the landfill has been accepted into the RDD program, the amount of liquid waste accepted can be significant. The acceptance of liquid waste also creates more leachate, which has to be stored in evaporation ponds. Most dry climate landfills do not recirculate leachate, again based on CEC's experience, because recirculating is not a disposal method for leachate. The waste will become saturated and then there are issues with slope stability. The leachate is typically stored in evaporation ponds where the liquid is evaporated but a solid residue is left behind, which is typically removed from the pond and disposed of in the landfill.

Geo-Logic ASSOCIATES

Memorandum

To: Jeff Condit **Date:** June 12, 2025

From: John M. Hower, Geo-Logic Associates, Inc.
Eric Tuppan, Tuppan Consultants, LLC.

Subject: Response to comments on CUP Application for the expansion of the Coffin Butte Landfill

The following are responses to public comments received following submittal of the Conditional Use Permit (CUP) application for the Coffin Butte Landfill.

Response to Comments concerning the effect of blasting on adjacent properties

Commenters noted that blasting used to break up and loosen rock for excavation can potentially interfere with uses on adjacent properties due to noise and the potential for seismic disturbance (rattling of windows), and interruption of groundwater flow.

Seismic Disturbances

Blasting has been used sparingly at the CBL, and only when the rock is too hard for removal by traditional earth moving equipment like excavators. At VLI, a blasting engineer develops a focused program to account for the area and quantity of material to be excavated and the geologic conditions, including rock fracture spacing and orientations to ensure that community disruptions are minimized. An appropriate monitoring program using seismographs is also implemented. VLI notes that in 2024 during excavation of Cell 5E, only two blasting events or shots occurred. Knife River, working in the quarry area that was developed as Cell 6, detonated 55 shots between early 2023 and the end of 2024.

Research by the U.S. Bureau of Mines (Duvall and Fogelson, 1962) and cited by the Oregon Department of Transportation website found that fracturing rock around a typical blast hole is limited to a distance of approximately 20-to-40-hole diameters away from the drill holes in which the explosives are packed. Thus, this is a standard of practice employed by blast engineers for this type of mass excavation. As an example, during excavation of the Cell 5 area,

Geo-Logic ASSOCIATES

4.5-inch diameter holes were drilled to depths of approximately 48 feet on 10-foot centers to loosen the rock. This resulted in a rock break distance of between 7.5 feet and 15 feet from each hole, using the rationale above. These findings suggest that the disturbance of rock resulting from blasting would likely be on the same order as disturbance of rock using conventional earth moving equipment.

Even with the short distance of rock fragmentation from the blasting hole, as a precaution, the contractor deployed seismographs to monitor ground vibration caused by the blasting at several locations along Military and Wiles roads on the north side of Coffin Butte near existing homes, at distances of approximately 1,100 to 2,300 feet from the excavation. The seismic wave velocities at those distances were all far below the criteria used for assessing ground vibration associated with building damage.

During the development of the future expansion area, VLI and/or its subcontractor will continue to will provide nearby residents with notification of future blasting events, and a seismic monitoring plan will be implemented for future blasting required for the development area.

Wilbur I. Duvall and Fogelson, D E. "Review of criteria for estimating damage to residences from blasting vibrations.", United States Department of the Interior, Bureau of Mines Report of Investigations 5968, Jan. 1962.

State of Oregon Department of Transportation pamphlet – Rock Blasting and the Community (https://www.oregon.gov/odot/geoenvironmental)

Interruption of groundwater flow associated with the proposed development.

VLI recognizes residents' concerns over the future water supply. As shown in annual groundwater monitoring reports and in Figure 1 (below), we note that the proposed development is located where groundwater flow from Coffin Butte and groundwater flow from Tampico Ridge converge. As a result, the local community south, southwest, and southeast of the proposed development is located upgradient of the proposed development. Groundwater monitoring during development of Cells 1 through 5 has not resulted in a significant change in the groundwater equipotential surface upgradient of these areas of the site as shown in the hydrographs and equipotential surface contour maps that accompany the annual water quality monitoring reports. Recognizing that the geologic conditions beneath the proposed expansion area and Tampico Ridge are similar to those under the existing landfill, modeling results support a conclusion that the proposed expansion is unlikely to result in change in the water resource that is different than the change that occurs seasonally during wet and dry seasons.

Geo-Logic ASSOCIATES

The ways in which a landfill development could interrupt groundwater flow include blasting (rock removal) and changes to recharge zones. This section evaluates those interruptions.

To better estimate the potential impact to residents, VLI prepared an analytical solution to characterize the change in water levels associated with the landfill development through blasting, rock removal, and placement of the composite liner system. All of the proposed development activities are located in areas downgradient of the local community, and as result, those activities should not affect recharge to wells or springs.

The potential changes in water levels at the Berkland and Holdorf wells resulting from the proposed landfill operation were evaluated. The two Berkland wells are closest to the proposed development area. The Holdorf well is farther to the south.

The analysis concluded possible decreases similar to the changes in water levels associated with seasonal precipitation patterns observed in site monitoring wells.

The analytical calculation included an area of several thousand feet beyond the southern edge of the proposed development area in order to evaluate conditions beyond the location of residential water supply wells that were modeled. These evaluations suggest that the change in head beyond about 3000 feet from the proposed development area would be far smaller, and would likely have no effect on well or spring water supply.

VLI recognizes that our neighbors rely on well water, and that springs are part of the appealing natural landscape. We will work closely with the community to monitor and address changes in local water supply wells and springs that may be affected by our operations. A methodological, stepwise approach to monitoring and evaluation will be conducted as follows.

- As part of the proposed expansion project, a network of four monitoring wells will be constructed along the southern side of the development. Water levels in these four wells will be regularly monitored as part of the CBL routine monitoring program. These wells will effectively act as "sentinel" wells to provide an added level of monitoring.
- Should these four new wells show four successive decreases demonstrating a 10 percent decrease in the potentiometric surface, or a dramatic change across two events (not associated with local climactic conditions or residential water use), VLI will request the ability to evaluate yield and water levels at residential wells. Furthermore, as part of this, VLI may install additional sentinel wells to the south of the four new monitoring wells.

- Additionally, if those sentinel wells show a decrease that is affecting neighbors, and that is unrelated to local climate conditions or changes in residential water consumption, VLI will reach out to those neighbors to evaluate and implement mutually-agreeable solutions at VLI's expense. VLI underscores that its evaluation and analysis does not support that there will be any material impact to neighboring residential well.
- VLI will remain open to discussion with interested residents about their wells and water levels.

Response to Comments concerning the presence of arsenic in groundwater

VLI has been monitoring groundwater chemistry at the CBL for more than 30 years in accordance with the requirements outlined by the State of Oregon Department of Environmental Quality (ODEQ). VLI acknowledges that since arsenic was first detected at well MW-9S, elevated arsenic concentrations have been detected in wells that monitor the east side of the facility; namely, wells MW-26, MW-27, and MW-9S; however, no monitoring results indicate that these arsenic concentrations are attributed to a leachate discharge. This section will:

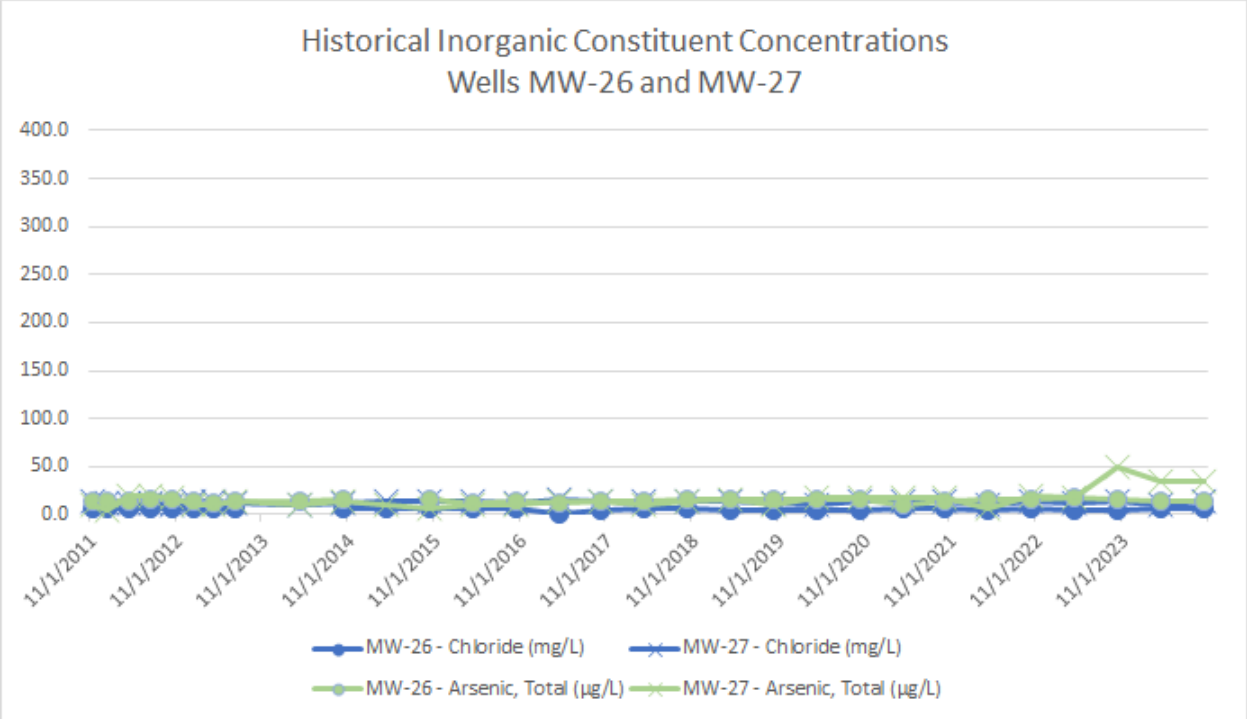
- describe the ways leachate impacts to groundwater can be determined, and present historical groundwater chemistry results for the subject wells,
- present public information regarding the basin-wide geochemistry with respect to arsenic and its natural occurrence in the area,
- describe the impacts of low dissolved oxygen content associated with local the natural environmental conditions along the eastern portion of the site, and its effect on arsenic concentrations in this area of the site
- propose actions should a release to groundwater be identified and verified.

Determination of Leachate Impacts to Groundwater

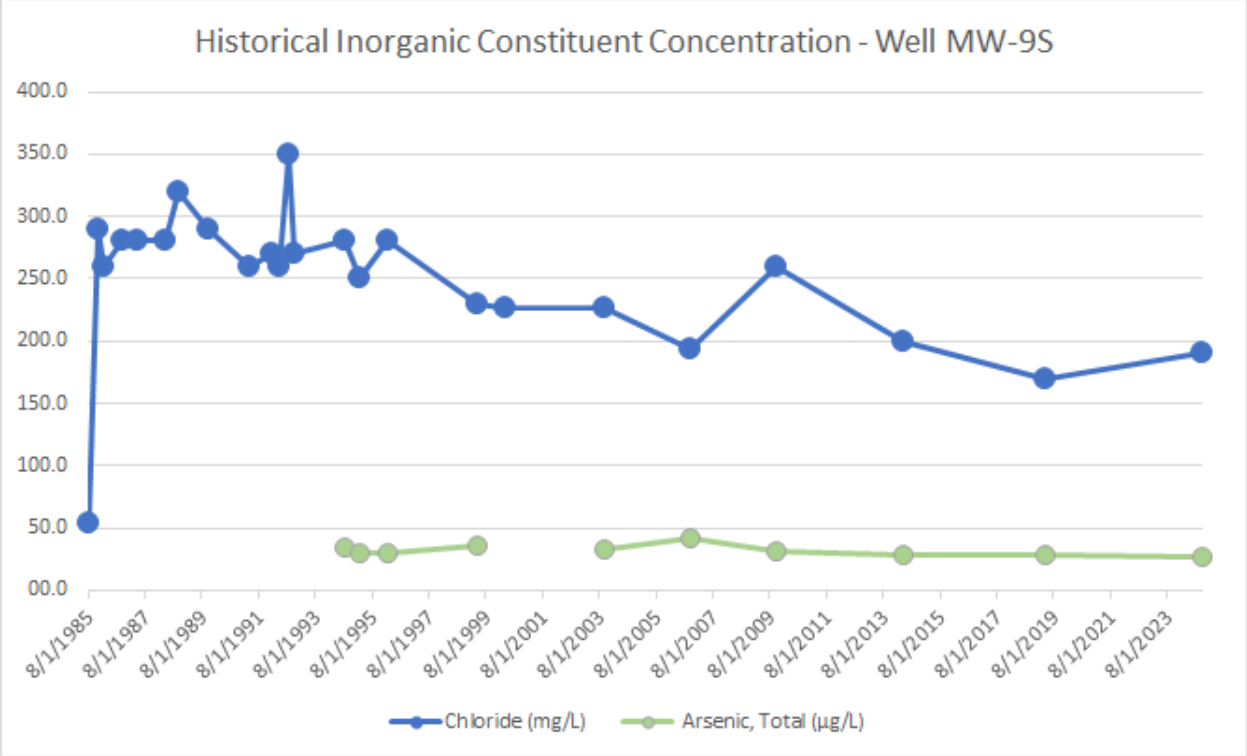
Typical for a MSW landfill, the monitoring program at CBL monitors both leachate and groundwater quality. The leachate at CBL is monitored annually at primary and secondary leachate sampling locations. Historical data show that leachate at the CBL is composed of elevated concentrations of inorganic constituents (for example: total dissolved solids, chloride, sodium) and some metals including arsenic as well as volatile organic compounds. Chloride in

particular is a useful tool for determining leachate influence on groundwater; whereas arsenic is not. Chloride is a conservative indicator of a release because the ion will move at the same rate as groundwater and will not attenuate due to chemical reactions and interactions. A release from a landfill is determined by observing changes in a suite of geochemical parameter concentrations in detection monitoring wells. This monitoring is conducted in accordance with the ODEQ-issued permit and data submitted to that agency.

Evaluation of groundwater data trends for key inorganic indicator parameters is a reliable method used to determine if groundwater has been affected by leachate. Considering that concentrations of inorganic constituents in leachate are significantly higher than in groundwater, if a leachate discharge were to occur, concentrations of many inorganic monitoring parameters - particularly chloride - would increase over time. Time-series charts depicting chloride and arsenic concentrations measured over time in samples from wells MW-9S, MW-26, and MW-27 are provided below. These charts illustrate that concentrations of these monitoring parameters have been relatively static over time. The absence of increasing concentrations supports the conclusion that groundwater at these wells is not affected by a leachate release.



Geo-Logic ASSOCIATES



In addition to inorganic constituents, the leachate at CBL contains measurable concentrations of chlorinated aliphatic compounds (including, tetrachloroethene, cis-1,2-dichloroethene, methylene chloride, and several others) and chlorinated aromatic compounds (benzene, 1,4-dichlorobenzene, chlorobenzene, toluene, xylenes, and ethylbenzene). These VOCs have been repeatedly detected in leachate samples collected over the last 30 years. Conversely, no VOC has been detected and verified in groundwater samples collected from wells MW-26, MW-27, or MW-9S. Taken together, the stable inorganic constituent concentrations and the absence of VOCs in samples from these wells indicate that the arsenic concentrations in this area of the site are naturally occurring. Fluctuations in arsenic concentrations are discussed below.

Regional Occurrence of Arsenic in Groundwater

The occurrence of arsenic in the region is documented in a technical publication by the U.S. Geological Survey (Hinkle and Polette, 1999), which identified naturally occurring arsenic minerals occurring in volcanic rock including the same types of geologic materials underlying the CBL. That publication focused on areas in the Willamette Basin using publicly available data from water wells in Lane and Linn Counties and in the Tualatin Basin where arsenic has been found in groundwater. That document cautions, however, that *"… it cannot be assumed that these areas are the only areas in the (Willamette) basin that contain ground water with high concentrations of arsenic. Little or no data exist for many parts of the basin."* The important

takeaway from that document is that arsenic is present in the Willamette Basin, and that it can be present in areas outside the data set that the authors used.

The USGS study also evaluated temporal changes in arsenic concentrations over the course of the year. The study found that at some wells, arsenic concentrations changed by up to 50 percent of the original sample concentration from one sampling event to the other. The changes in arsenic concentration were independent of seasonal influences, and the study concluded without a working hypothesis to explain those variations. Arsenic concentrations in samples from wells MW-26, MW-27, and MW-9S also exhibit variations between sampling events and appear to be related to the level of dissolved oxygen in groundwater at the time of sampling, as described below.

Effect of Dissolved Oxygen on Arsenic Concentrations

The mechanism that releases the naturally-occurring arsenic from the native iron oxides locally at Coffin Butte is contact with groundwater that has a low dissolved oxygen content. This low dissolved oxygen is related to the former depositional environment on the eastern side of the landfill, which was a marsh or wetland with organic rich clays. These conditions are clearly noted in the boring logs for well MW-27, and were geologically mapped in the vicinity of wells MW-26 and MW-27 during excavation of Cell 4. When low dissolved oxygen groundwater comes in contact with soils, it dissolves the iron oxides and releases both the iron oxide and associated arsenic into the groundwater where it is measured and as seen in monitoring wells MW-26 and MW-27. As groundwater migrates beyond areas of low dissolved oxygen, the iron oxide and arsenic precipitate back to the soil, reducing the concentrations in groundwater. Natural variability over time within the same well can result in fluctuations in arsenic concentrations such as at MW-27 and as presented in the 1999 USGS study. Understanding the geologic conditions at the site in relation to the arsenic concentrations, ODEQ has found this rationale sound in approving the detection monitoring program for the east side of the landfill.

Response Actions to Community Concerns

As demonstrated above, more than 30 years of groundwater monitoring results support the conclusion that the arsenic concentrations measured in samples collected from wells MW-9S, MW-26, and MW-27 are associated with a naturally-occurring condition that exists on the eastern side of the landfill property. Furthermore, none of the data collected from these wells show indications of leachate impact over the last 30 years. Solid Waste Permit 306 requires VLI to continue to monitor water quality throughout the active life and post-closure period of the landfill, and take appropriate remedial measures in the event that a release to groundwater occurs. VLI is committed to complying with our site-specific, State of Oregon, and federal

landfill operations and monitoring requirements. ODEQ has accepted VLI's explanation for the presence of arsenic in groundwater near the eastern property boundary, and through this understanding, the agency has not mandated further evaluation, implementation of a formal assessment monitoring program, or corrective actions.

VLI acknowledges the community's concern regarding local arsenic concentrations and potential water quality changes associated with the proposed development. As a measure to help foster better understanding of the issue, and respond should the issues arise, VLI proposes a methodical, stepwise approach, including:

- The installation of a network of four groundwater monitoring wells around the perimeter of the proposed facility. The new monitoring wells would be installed prior to placement of waste in the new cell in order to obtain background water quality data as it relates to the new cell.
- In addition, VLI, with property-owner approval, proposes to sample domestic water wells immediately south of the landfill (i.e., along Blaze Drive and Ploughshares Road) for arsenic and chloride once a year to track levels moving forward. This sampling program will begin before landfill construction to establish a baseline for arsenic and chloride concentrations in those wells.
- If changes in concentrations above baseline levels are measured and can be attributed to landfill operations, VLI will work with property owners to remedy the condition.

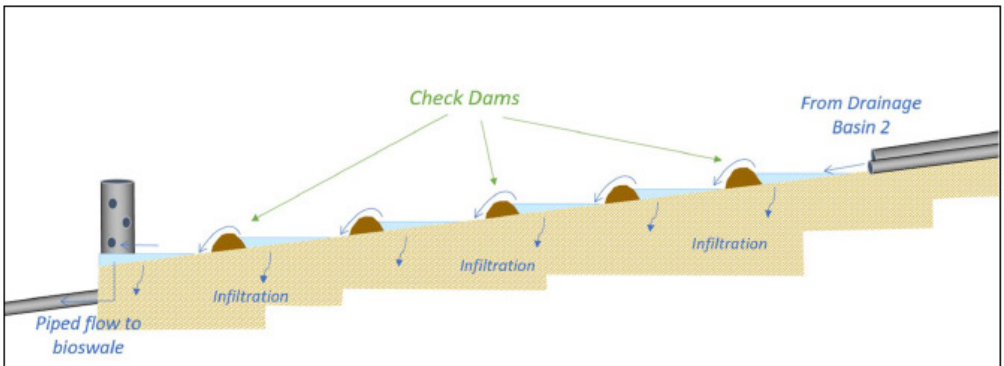
Response to Comments concerning stormwater and surface water management in the current development area.

Surface water and stormwater at the CBL is divided into three drainage areas:

- Area 1, which drains the Knife River quarry, and is permitted under the Oregon 1200-A permit through Knife River
- Area 2, which incorporates the western area of the CBL and discharges at Outfall 001, and is permitted under the Oregon 1200-Z permit
- Area 3, which incorporates the eastern area of the CBL and discharges at Outfall 002), and falls under the same permit at Area 2.

Drainage Area 1 is operated under a separate permit, and is not included in the CUP application. Drainage Area 2 and 3 each discharge to a different outfall (Outfalls 001 and 002 respectively). Drainage Area 2, located on the west side of the Site, is a 43-acre area that drains to the west towards Soap Creek, which is more than 500 feet from the Basin 2 outfall point. The stormwater infrastructure in this area of the site consists of pipes and a large end-of-pipe sedimentation basin (Pond 3) followed by a large bioswale. In 2021, Pond 3 was modified with six impermeable check dams, or berms, to increase the hydraulic retention time of the basin, thereby enhancing gravitational settling of particulate solids, and increasing mass reduction by infiltration. The berms bisect the basin across its longitudinal axis, extending across the width of the basin between the two side embankments. Gravel-filled trenches were placed in front of the first two berms to promote infiltration. Each berm has a weir that water flows over when the depth behind the berm rises above the weir crest and discharges to the next lower step pool. The inverts of the weir crests are approximately 4 inches lower than the top of the berms. The last step-pool discharges to a large area at the downstream end of the basin where water ponds and additional infiltration occurs before discharging through an outlet structure. A schematic of this system is shown below.

The addition of check dams has spread out the flow across the large surface area of the pond, promoting larger, shallow ponding areas. The check dams result in a step-pool like structure which has greatly increased the retention time and infiltration of runoff.



Schematic of Drainage Area 2 Infrastructure. Source, Geosyntec Consultants.

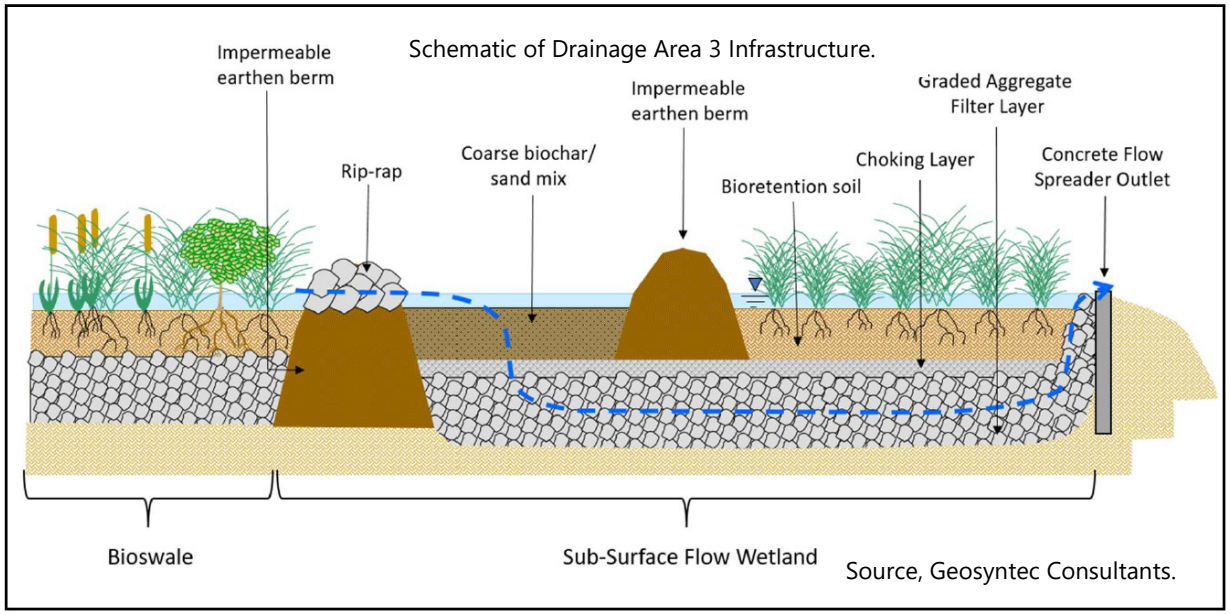
Drainage Area 3 consists of the active landfill and primary Facility operations located on the east side of the Site, including the proposed expansion area facilities. Most of the area is or will be covered with landfill wastes, and most of the landfill, and each cell of the landfill in this drainage area is equipped with a composite liner system, rendering the area impervious. Other areas of impervious surfaces include truck scales, loading bays, building roofs, and Coffin Butte Road. Overall, Drainage Area 3 contains about 26.6 acres of impervious surface and is therefore

approximately 21.5 percent (%) impervious. Stormwater runoff from the active landfill north of Coffin Butte Road is generated both from active cells and covered, inactive cells. The area south of Coffin Butte Road includes the area surrounding the existing leachate treatment facility, leachate holding ponds, and landfill gas power generation facility. Stormwater from Drainage Area 3 is routed through a series of existing treatment controls (i.e., BMPs) prior to discharging to Toketie Marsh over a flow spreader weir, where it is sampled. Toketie Marsh discharges to an unnamed tributary of Soap Creek. Soap Creek discharges to the Luckiamute River, and then to the Willamette River.

Existing end-of-pipe BMPs in Drainage Area 3 include two large sedimentation basins, located to the northeast and southeast of the active landfill area, a large bioswale that receives water from both sedimentation ponds, and a subsurface wetland (installed in 2021) that receives effluent from the bioswale. The more northern sedimentation basin (Pond 2) is approximately 32,000 square feet and receives runoff from the areas north of the active landfill through a 30-inch storm pipe. The more southern sedimentation basin (Pond 1) is approximately 26,000 square feet and receives runoff from the active and inactive landfill cells, which generally drain to the east, through a 36-inch storm pipe. Both ponds drain towards the centerline of the landfill area where they combine into a 48-inch storm pipe that drains to the large bioswale, which takes up approximately 45,000 square feet.

In 2021, a portion of the existing east bioswale was converted to a sub-surface flow wetland (SSFW). A conceptual overview of the constructed SSFW is depicted below and includes an impermeable berm bisecting the swale at its northern end that forces water down through a sand/biochar media filter and into a subsurface gravel layer. After passing through the treatment media, water flows horizontally through the gravel layer beneath the impervious berm and re-emerges on the surface on the downstream side. Bioretention media planted with native wetland plants was placed above the gravel layer on the downstream side of the berm. Treated surface water flows over a flow spreader weir at the northern end of the subsurface wetland, where it is sampled, prior to being discharged to Toketie Marsh.

Geo-Logic ASSOCIATES



Schematic of Drainage Area 3 Infrastructure.

Source, Geosyntec Consultants.

Outside of the operations areas, precipitation that falls on the northeastern slopes of Tampico Ridge drains north to a ditch along the south side of Coffin Butte Road, which conveys the intercepted stormwater eastward toward Highway 99. Stormwater then flows through a culvert beneath Coffin Butte Road, continuing northward in the drainage ditch along the west side of Highway 99 to a culvert that conveys water from a wetland and this ditch to a creek on the east side of Highway 99.

Response to Comments concerning Stormwater and Surface Water Management in the Proposed Development Area

Stormwater from the proposed landfill development area will ultimately be directed toward the east and use existing stormwater controls described in the discussion of stormwater controls for the existing landfill (see preceding response). As presented in the CUP application supporting documentation, the proposed stormwater design captures stormwater using graded swales and conveys the water to catch basins. The catch basins direct stormwater flows to a combined detention and wet pond facility located to the east of the landfill footprint. The purpose of this facility is to slow down the flow rate to allow sediment to settle out of the flow stream before water is discharged. The outflow of onsite stormwater from the wet pond will be conveyed through a graded swale to a 12-inch culvert crossing to the north side of Coffin Butte Road and

ultimately discharge to the existing detention facility and bioswale that include a sub-surface flow wetland where stormwater will undergo additional treatment before discharge off site.

The combined detention and wet pond were designed for the project site according to the current City of Corvallis Stormwater Design Standards. Surface water will be monitored in accordance with the current ODEQ-issued NPDES Stormwater permit, which requires stormwater monitoring on the east side (for the current landfill) as well as monitoring stormwater west of the proposed development area. Stormwater that discharges to the west originates on the existing landfill north of Coffin Butte Road, generally on the western part of the landfill. After treatment, discharge from the western part of the landfill flows into Soap Creek.

As the project design progresses, VLI will develop comprehensive designs for drainage structures. These designs will be supported by hydraulic calculations to demonstrate that each component of the stormwater management system for the proposed development area is sized to accommodate the design storm event for the facility. This procedure is typical of development projects of all types and will be conducted in accordance with the appropriate engineering standards and pertinent regulations. The final drainage system design will be reviewed and approved by ODEQ prior to finalizing the bid documents for construction.

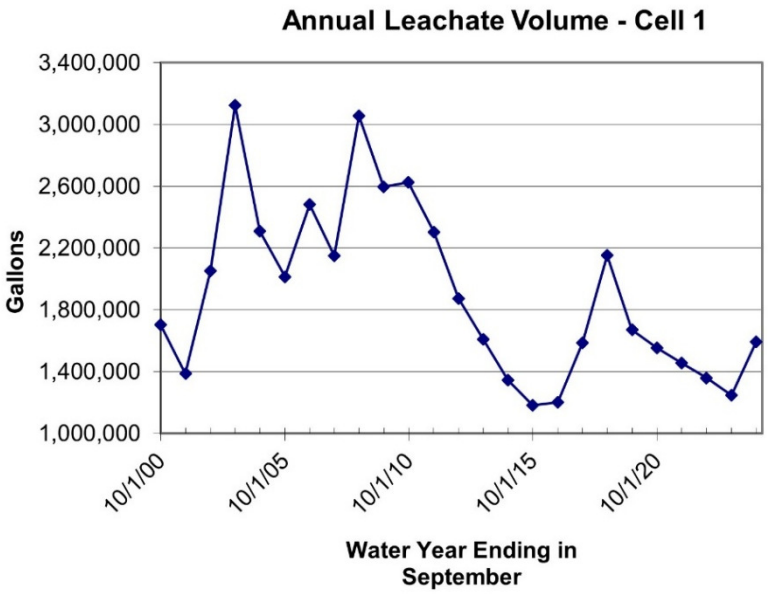
Response to comments concerning current stormwater runoff flowing into Knife River Quarry

A comment reported an observation that stormwater runoff from the existing landfill entered the Knife River quarry pond. Current topography, grading and engineered drainage controls prevent stormwater runoff from the existing landfill from flowing into the Knife River quarry pond. The current stormwater protection plan for the landfill identifies stormwater flow basins based on topography. Site drainage and grading direct stormwater runoff away from the quarry operations. VLI notes that stormwater in the western part of the landfill, primarily the closed parts of Cell 1 and closed Cell 1A, flows within what is referred to as Drainage Area 2 and discharges to Outfall 001. Although this drainage area shares a common boundary (based on topography) with the Knife River drainage area; existing grades and engineered controls are designed to prevent stormwater runoff from landfill areas comingling with runoff from the quarry area, as shown in Figure 2.

Geo-Logic ASSOCIATES

Response to Comments concerning the volume of leachate produced in Cells 1 and 1A.

VLI monitors leachate production rates for each cell on a daily basis. The volume of leachate generated in each cell is transmitted to a pipeline equipped with a calibrated flow meter, and the meter is read and recorded daily, allowing operations staff to observe changes in leachate production. Annual leachate production volumes from Cell 1 between 2000 and 2024 are presented in the graph below and are based on the "water year" beginning on the first of October of one year and extending through the end of September of the following year. For the 2025 water year to date, the Cell 1 leachate production is 880,390 gallons, which should project to a water year total of approximately 1.2 million gallons. As shown on the graph, leachate generation volumes have generally decreased over time, though transient increases in generation occur following periods of higher-than-normal precipitation. During the last five years, the annual leachate production from Cell 1 has been less than 1.7 million gallons.



With placement of flexible membrane final cover systems, which act to prevent infiltration and, thus, leachate generation, over Cell 1A and most of Cell 1, leachate generation rates will continue to decline.

Geo-Logic ASSOCIATES

Response to Comments concerning concentrations of metals and PFAS in leachate

As required by Solid Waste Permit 306, annual leachate samples are analyzed for 15 metals and reported in the Annual Environmental Monitoring Report (AEMR). Data published by the USEPA in 2002 (Kjeldsen, et. al, 2002 – Present and Long-Term Composition of MSW Landfill Leachate: A Review), show that concentrations of metals in leachate samples collected at the CBL are comparable to the leachate chemistries at other municipal solid waste landfills. As shown below, the arsenic concentrations in leachate at the CBL are near the bottom of the range of arsenic values reported by the USEPA. VLI notes that, because they are targeted to drinking water quality, USEPA primary drinking water standard Maximum Contaminant Levels (MCLs) referenced in various comments are not applicable to leachate.

Comparison of EPA Cited Ranges for Metals Concentrations in Leachate with Average Leachate Values at Coffin Butte Landfill

Constituent	EPA cited ranges		Coffin Butte Leachate
	Minimum Value	Maximum Value	Average Value
Arsenic	100	1,000	111
Cadmium	1	400	2.61
Calcium	10,000	7,200,000	129,000
Chromium	20	1,500	160
Cobalt	5	1,500	50
Copper	5	10,000	15.8
Magnesium	30,000	15,000,000	145,000
Lead	1	5,000	5.5
Iron	3,000	55,000,000	6,040
Manganese	30	1,400,000	984
Mercury	0.1	160	0.70
Nickel	15	13,000	161
Zinc	30	1,000,000	419

All values are reported in micrograms per liter (µg/L)

Source: Peter Kjeldsen, Morton A. Barlaz, Alix P. Rooker, Anders Baun, Anna Ledin, and Thomas H. Chistensen, 2002, "Present and Long-Term Composition of MSW Landfill Leachate: A Review" *in* Critical Reviews in Environmental Science and Technology, V32(4), p297-336.

Per- and Polyfluoroalkyl substances (PFAS) are emerging contaminants recently recognized by the USEPA to be present in environmental media as a result of industrial discharges, use in commercially-available household products, and in fire-fighting foams. In fact, the use of PFAS is widespread, and these chemicals are present in products such as lip balms, lotions, makeup, sunscreen, food packaging, fire retardant, clothing, and cookware. Through their use in many household products, these chemicals have been found in samples of municipal solid waste

leachate at many landfills. Landfills are a receiver of many wastes containing PFAS and sequester these chemicals in a highly-engineered, closely monitored setting.

As an emerging contaminant, neither the current solid waste permit nor federal 40CFR258 regulations require testing for PFAS. However, leachate samples were collected in 2022 and 2024 at the request of the City of Corvallis. These samples were analyzed for PFAS in order to gain an understanding of their presence and concentrations in landfill leachate that was transported to its wastewater treatment facility. Twenty-seven PFAS compounds were detected during these two monitoring events at concentrations ranging from 7 to 36,000 nanograms per liter (ng/L or parts per trillion). For comparison, in 2022, the USEPA (Chen, et. al, 2022) published the results of a study of PFAS concentrations in landfill leachate. This study analyzed 26 PFAS compounds and found total concentrations of PFAS as high as 58,260 ng/L in leachate samples. In addition, between 2018 and 2020, the State of California Water Resources Control Board conducted a pilot study to evaluate PFAS concentrations in leachate at active municipal solid waste landfill throughout the State. Review of data from 12 California landfills that are equipped with leachate collection and removal systems shows cumulative PFAS results as high as 103,000 ng/L. Results from USEPA and the State of California suggest that the leachate PFAS data from the CBL is similar to PFAS concentrations in leachate at other municipal solid waste landfills.

As federal and state agencies gain an understanding of the presence of PFAS in the environment, permit requirements may change as far as routine monitoring or pilot testing. VLI will continue to comply with current and future permit requirements for this site.

Chen, Y., H. Zhang, Y. Liu, J. Bowden, T. Tolaymat, T. Townsend, and H. Solo-Gabriele. Concentrations of perfluoroalkyl and polyfluoroalkyl substances before and after full-scale landfill leachate treatment. WASTE MANAGEMENT. Elsevier Science Ltd, New York, NY, USA, 153: 110-120, (2022)

Response to Comments concerning leachate seeps

Past landfill operations experienced leachate seeps emanating from active faces of the landfill. Current operations utilize ethylene propylene diene monomer (EPDM) as an alternative interim cover material and linear low-density polyethylene (LLDPE) final cover systems as portions of the landfill reach design capacity. Combined with improved grading and drainage practices, the use of EPDM interim cover material and LLDPE final cover systems significantly limits the amount of precipitation that infiltrates landfill wastes. In addition, more robust leachate collection and

recovery as well as landfill gas collection systems that remove significant volumes of water vapor from the landfill that would otherwise promote leachate formation, and these environmental controls significantly reduce the likelihood of leachate accumulation and the formation of seeps. As a matter of practice, site operations personnel inspect the landfill during and immediately after significant or prolonged storm events to make sure that environmental controls are functioning correctly and to repair any storm-related damage as quickly as possible.

Response to Comments concerning the absence of clay below the liner system.

Cells 1A and 1 were first used for waste disposal in 1975. Both cells were developed prior to the adoption of regulations and practices requiring construction of landfill liner systems, and historical records indicate that minimal excavation was conducted in these areas of the site prior to initiating waste disposal operations. Historical records indicate that Cell 1A was developed on exposed bedrock. The southern portion of the Cell 1 area was originally underlain by native alluvium, and that material was removed prior to waste placement and used to construct an approximately two-foot-thick clay liner over portions of the Cell 1 subgrade and an engineered fill toe berm. In addition, Cell 1 is equipped with a leachate collection system. Leachate is extracted from Cell 1, and is managed in accordance with the terms of the current solid waste permit. Portions of Cell 1 and all of Cell 1A have been formally closed in accordance with Oregon Administrative Rules, Chapter 340, Division 94 (OAR 340) and Federal Subtitle D regulations found in the Code of Federal Regulation, Part 258 (40CFR258).

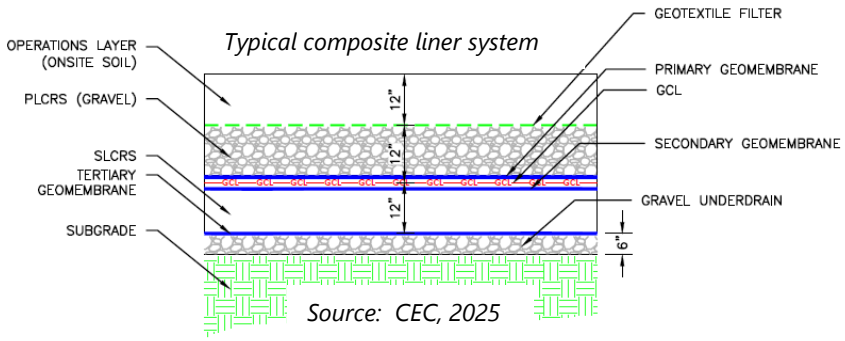
Acknowledging the absence of modern landfill liner systems that were available at the time these cells were constructed, VLI installed the leachate collection system and numerous groundwater monitoring wells downgradient of these cells. As a result, the leachate collection and monitoring system now meets or exceeds current regulatory standards. These efforts are to remove leachate for proper disposal, and to allow evaluation and appropriate response should changes in groundwater chemistry be detected in this area of the landfill.

Proposed Expansion Area Liner System

With respect to the project proposed in the CUP application, the composite liner system proposed for the landfill expansion is designed to meet or exceed OAR 340 and 40CFR258 design standards for municipal solid waste landfill liner systems. The composite liner system design planned for the expansion area extends below the entire landfill footprint. The excavation will result in slope areas and a floor area. Slope areas will descend from a high point

of approximately 370 feet above mean sea level near the southwestern portion of the development area to an elevation of approximately 250 feet above mean sea level near the northeastern portion of the development area. Slope areas will be developed at a gradient of 2 (horizontal) to 1 vertical, and the floor area of the development will be graded to drain to the northeast at a gradient of 2 percent. The multiple-layer composite system contains the following key components, from bottom to top:

- An underdrain layer of sand or gravel (or other possible geosynthetic component) that keeps the groundwater from impinging on the liner.
- A tertiary geomembrane, referred to as a flexible membrane liner (FML), of high-density polyethylene (HDPE) that separates the groundwater from lower layers of the liner system.
- A second layer of sand or gravel (or other possible geosynthetic component) that provides for detection and secondary containment of possible leaks. This layer is monitored for volume and water quality as part of the detection monitoring program.
- Two more FML layers (primary and secondary geomembranes separated by a geosynthetic clay liner) to provide containment of leachate and fluids produced within the landfill. •



- A 12-inch-thick leachate collection and removal system (LCRS) designed to collect and remove leachate generated in the landfill and convey the liquid to a pond for treatment; this prevents the accumulation of leachate along the base of the landfill and removes the downward hydraulic pressure that could drive leachate from this layer into the underlying secondary layer and to groundwater.
- A 12-inch-thick operations layer comprising on-site soils that reduces the likelihood of waste materials damaging the composite liner system components

As currently proposed, the composite liner system design far exceeds the OAR 340 and 40CFR258 standards. The final design and installation will be approved by the DEQ and construction will be closely monitored, tested and certified by a professional engineer, consistent with a DEQ-approved quality assurance and quality control plan.

MEMORANDUM

TO: Jeffrey G. Condit– Miller Nash LLP

FROM: Jeff Leadford, P.E. – SCS Engineers

SUBJECT: Coffin Butte Landfill 2024 Expansion Application Odor Dispersion Modeling Study Supplemental Information

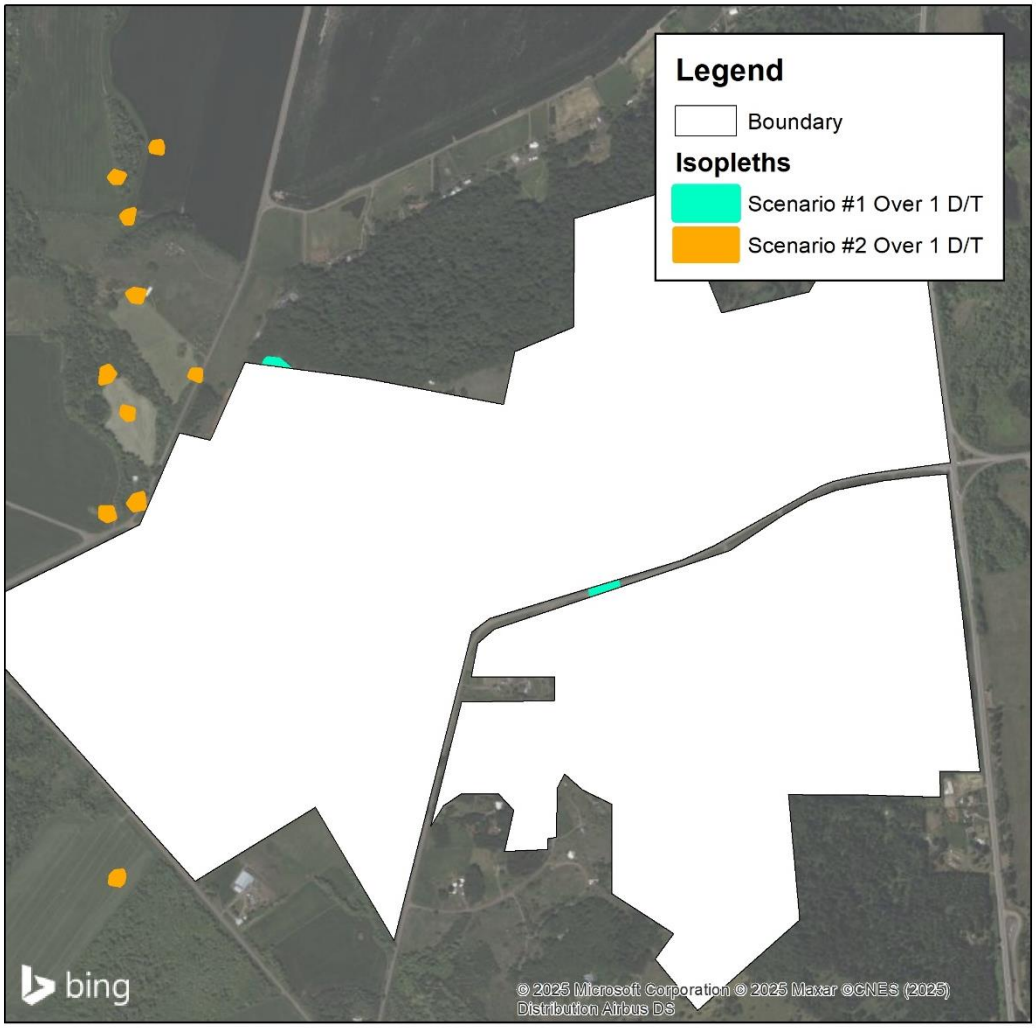
This memo provides a brief supplement to the June 6, 2025 update to the Coffin Butte Landfill 2024 Expansion Application Odor Dispersion Modeling Study ("June 2025 Model").

For purposes of the June 2025 Model, each modeling scenario was shown in units of micrograms per meter cubed (ug/m3) at peak, off-site, 1-hour pollutant concentrations. Each pollutant impact was then compared to its odor threshold via it's D/T (i.e., maximum impact divided by odor threshold). A D/T ratio of one indicates that roughly half of people can detect an odor at a given location for a given hour. A D/T of 7 is expected to result in a odor "nuisance" in most states, though this number is variable and not quantified in Oregon.

Figure 1 provides a further illustration of odor dispersion modeling in the June 2025 Model as requested by Maul Foster and Alongi upon their review of the study. In Figure 1 below, the green shows the extent of odor detection of hydrogen sulfide outside the property boundary. As shown in the Table 6 of the June 2025 Model, this pollutant had the highest dilution to threshold ratio (D/T) and thus was most likely to be detected offsite. The yellow shows the extent of odor detection of dimethyl sulfide, which has the highest D/T per Table 7 in the June 2025 Model.

MEMORANDUM
June 20, 2025

Figure 1: Odor Modeling Over 1 D/T



As explained in the June 2025 Model, namely Sections 4.0 and 5.3, a variety of factors influence odors relative to the D/T measurements in the model. There are a few factors that make odor modeling somewhat subjective for odors on a given day. As explained in the June 2025 Model's uncertainty analysis (Section 5.3), the air modeling program has limitations at low wind speeds and is not able to model thermal inversions which could be present around Coffin Butte. These conditions could increase or decrease odor levels. In addition, certain landfill activities may temporarily increase odor. Such activities are addressed in detail in Jeff Condit's April 29, 2025 letter to the Planning Commission.

Setting a specific odor detection threshold is also highly variable as each person detects odors subjectively.

If you have any questions, please contact Jeff Leadford at jleadford@scsengineers.com or 720-272-0172.

RE: *Republic Services Coffin Butte Landfill – VNEQS Comment Responses*

This memorandum provides responses to comments provided by the Valley Neighbors for Environmental Quality and Safety (VNEQS) on June 10, 2025. Individual comments raised by VNEQS in the detailed comments section pertaining to noise (beginning on page 7) are addressed below.

Community Addresses Flaws in the Applicant's Consultant's Study

FLAW #1 IN CONSULTANT'S STUDY – REMOVAL OF VOLUME CAP – NOISE ANALYSIS NOT ADJUSTED FOR NOISE IMPACTS INCREASING IN TANDEM WITH WASTE VOLUME INCREASES Applicant's consultant's submittal does not take into account removal of the intake cap, which will have the effect of increasing noise impacts 1:1 in tandem with waste volume increases (69%/100%/100%+)[7]. Applicant's own drawings show an increase over current volumes of 69%, but Applicant has shown capacity to double volumes in the past (as from 2017 to 2019). With no constraint in the intake cap, any analysis of potential future impacts should not perform noise analysis using current noise volume, but at least 169% of current noise volume (using Applicant's own volume estimates for years 5&6 of the proposal), or 200% of current noise volume if Applicant exceeds estimates and conforms to historical increases.

The noise study is based on information about future traffic volumes accessing the expansion area and is not based on current traffic volumes. The comment references note 7, which lists the future and current allowable fill volumes and divides the two volumes to establish the 69% increase. Additional fill capacity does not mean more noise; it simply means the site would have additional capacity.

FLAW #2 IN CONSULTANT'S STUDY – NO CONSIDERATION OF SITE PREPARATION IMPACTS Applicant's consultant's submittal does not take into account site preparation noise (unknown impacts), applicant has not provided a timeline or plan, but removal of enough material (mostly basalt) to equal the volume of THREE EMPIRE STATE BUILDINGS (3,500,000 CUYD) will not be accomplished quietly or swiftly.

The Benton County Code does not provide regulations for construction noise and construction noise is exempt from Oregon Administrative Rules sound limits under OAR 340-035-0035(5)(g).

Potential Code Citations – Potential Findings for Denial, Noise, Part I

53.215 (1) NOISE SERIOUSLY INTERFERE – INCREASED WASTE DISPOSAL VOLUME = INCREASED NOISE Applicant's consultant's analysis considers only current noise impacts, not future noise impacts that would result from

increased activity resulting from increased volumes of waste accepted. Noise could increase 69%/100%/100%+ over current noise recorded (not including site preparation, see below).

The noise study is based on future traffic volumes accessing the expansion area and is not based on current volumes. Additional fill capacity does not correlate to more noise; it simply means the site would have additional capacity.

53.215 (1) NOISE SERIOUSLY INTERFERE -- SITE PREPARATION = INCREASED NOISE Applicant's consultant's analysis considers CURRENT NOISE IMPACTS, NOT FUTURE NOISE IMPACTS THAT WILL RESULT FROM EXTENSIVE SITE PREPARATION "before and after" operating hours, i.e. all the time. This noise will be extremely disruptive, consisting of blasting – YEARS of blasting, scraping, beeping, loading dump trucks, unloading dump trucks, truck travel, etc.

The Benton County Code does not provide regulations for construction noise and construction noise is exempt from Oregon Administrative Rules sound limits under OAR 340-035-0035(5)(g). Noises caused by "beeping" which is assumed to refer to backup alarms or other safety devices are exempt from OAR sound limits under OAR 340-035-0030(3)(b).

Community Addresses DEQ Regulations

DEQ REGULATIONS ARE NOT LAND USE CRITERIA DEQ Regulations protect PUBLIC HEALTH; Land Use protections protect one land use from potentially incompatible uses; such protections do not necessitate a health component. A one-time 49-decibel noise would have an entirely different impact on an "adjacent" (however defined) property than a 49-decibel noise that continued 24/7. Either would be allowed by DEQ; the latter situation, however, might properly result in land use application denial. In LU 21-047, The Planning Commission addressed this squarely, and succinctly summarized the disconnect as follows: "…There is no ability for the Planning Commission to review the situation after DEQ's approval to ensure that DEQ's standards were adequate to prevent the proposed use from seriously interfering with uses on adjacent property."

DEQ noise regulations were developed based on criteria developed by the Environmental Protection Agency in Information on Public Health and Welfare Criteria for Noise (July 1973) and Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (March 1974) as an outcome of the Noise Control Act of 1972. These documents thoroughly assess noise and its effects on humans, not only health effects but also other affects such as speech and sleep interference. The substantial increase threshold of 10 dB adopted by DEQ is also consistent with EPA guidance in EPA EIS Guidelines for Region X (April 1973). In our experience, the DEQ noise regulations are one of the most comprehensive regulatory framework for assessing potential noise effects from noise sources such as the Coffin Butte expansion. The proposed project, including additional mitigation measures proposed since the Noise Study was published, will be far below DEQ noise standards and not present any adverse effects on the surrounding properties.

DEQ REGULATIONS ARE NOT CURRENTLY ENFORCED AND COMMUNITY BELIEVES THEY ARE CURRENTLY EXCEE[C]DED DEQ regulations are not enforced; and Benton County does not have a noise ordinance to enforce. An unenforced regulation relies on voluntary compliance, and there has been considerable public testimony to the effect that the Applicant frequently does not comply with unenforced regulations (i.e. EPA emissions, OSHA, DEQ, etc.)

The Applicant has proposed additional noise control and monitoring measures to assess compliance with DEQ noise limits on a regular basis, which could be added as a condition of approval, enforceable by Benton County.

Potential Code Citations – Potential Findings for Denial, Noise, Part II

53.215 (1) NOISE ALL THE TIME The Applicant proposes to engage in landfill operations from 5 am to 5 pm and to engage in site preparation "after and before" operating hours. "After and before" is equivalent to "all the time". The Applicant's proposal, by subjecting adjacent properties to the constant noise – at approximately double current volumes -- of an operation which Benton County Public Works testified was already the "most intensive" industrial operation in Benton County would constitute significant adverse impact.

It is our understanding that any operations conducted outside the 5am to 5pm hours would not generate any notable levels of noise.

53.215 (1) APPLICANT CURRENTLY OUT OF COMPLIANCE WITH DEQ NOISE REGULATIONS The Applicant has been promising neighbors for years that it will replace the existing backup alarms that awaken them before dawn, but to date has yet to do so. Backup alarms produce a noise that ranges from 87 to 102 dB (twice the DEQ regulatory limit for night-time noises), and by OSHA standards must be audible above the surrounding ambient noise level (which is why they are so loud). Applicant currently starts landfill operations at 5:00 a.m., TWO HOURS BEFORE DEQ ALLOWS, awakening residents in surrounding homes at that time with the loud beeping of backup alarms (see testimony, Grant Carlin). Consequently, it is probable that landfill operations are already out of compliance with DEQ noise regulations mandating noises no louder than 50 dB at night from 10 p.m. to 7 a.m. It is reasonable to assume that if the Applicant is currently out of compliance with regulations, non-compliance will continue if this application is not denied.

Although noise from backup alarms is exempt from OAR sound limits, backup alarms will be replaced with ambient sensing broadband backup alarms. Ambient sensing broadband backup alarms are typically quieter than standard alarms, adjust their volume based on the surrounding noise environment, and replace tonal alarm noises ("beeping") with broadband noise. During times when the surrounding sound levels are low, the alarms are quiet and if sound levels in the area increase the alarm also increases to maintain audibility and comply with safety standards. Ambient sensing broadband backup alarms are typically 5 to 10 dB above the ambient noise level, ensuring reliable audibility while limiting overall sound levels.

The statement that "backup alarms produce a noise that ranges from 87 to 102 dB (twice the DEQ regulatory limit for night-time noises)" does not include a distance for these sound levels and it is therefore not appropriate to compare these to OAR sound limits that are established at noise-sensitive receptors. Given the distance from existing operations, backup alarms, which are exempt from OAR sound limits, would not result in sound levels of 87 to 102 dB at nearby properties.

The statement that the "applicant currently starts landfill operations at 5:00 a.m., TWO HOURS BEFORE DEQ ALLOWS" is incorrect. The OAR does not prohibit the site from operating before 7 a.m., but the OAR does reduce the allowable sound levels during nighttime hours, which was accounted for in the noise analysis.

Sincerely,

Adam C. Jenkins, PE, INCE Bd. Cert., CTS-D

MEMORANDUM

TO: Jeffrey G. Condit– Miller Nash LLP

FROM: Jeff Leadford, P.E. – SCS Engineers

SUBJECT: Valley Neighbors for Environmental Quality and Safety Testimony Response at the Coffin Butte Landfill

The Coffin Butte Landfill (Coffin Butte, or Landfill) is currently in the application process of a proposed expansion. On June 10, 2025 the Valley Neighbors for Environmental Quality and Safety (VNEQS) submitted testimony and documents in opposition to the proposed expansion effort (Testimony). This memo serves as the SCS Engineers (SCS) response to this Testimony's odor-specific issues raised, including critiques of SCS's "Coffin Butte Landfill 2024 Expansion Application Odor Dispersion Modeling Study (Modeling Study). The odor portion of the Testimony starts on Page 10 of the submittal with a summary starting on Page 3. SCS is providing the following responses to flaws mentioned in the Testimony:

The VNEQS states that "the odor consultant's assertion that 1% of odor complaints are "likely" caused by the landfill" [Testimony Page 5] and "Applicant's consultants then conclude that only 1% "likely" originate from the landfill" [Testimony Page 10]. These statements are misleading as they both take the odor complaint analysis results out of context by failing to mention the results were based upon correlation to wind conditions measured on-site. If complaints did not include location and/or time stamps, then they could not be properly corelated to the Landfill as the potential odor source.

Flaw #1 translates cubic yards to tons and mentions these are roughly comparable, but gives no reference to that comparison. Landfill municipal solid waste (MSW) does compress over time, but this will end up with less volume as well. Coffin Butte's Waste in Place report for 2023 noted only 21,537,961 tons in the landfill by the end of 2023. A standard ratio of 0.6 tons per cubic yard is used in the industry, which is significantly less than what the Testimony implies.

Flaw #2 mentions that the closure year is incorrect. Years of capacity in both the current landfill area and expansion area are estimates. Year 2052 was determined (as mentioned in Section 3.2 of the Modeling Study) assuming 2023 waste acceptance rates continued moving forward until the full capacity of 41,110,068 tons was reached.

Flaw #3 cites inconsistencies in landfill gas collection efficiency. There are various estimations of collection efficiency at landfills, and all are quite variable. The EPA has determined a conservative default efficiency of 75% which is referenced on Page 10 of the Modeling Study. VNEQS is using

Carbon Mapper to estimate collection efficiency in this Flaw citation, but gives no data to backup its claim. A brief aerial map of methane at the Landfill from Carbon Mapper does not seem to give an accurate representation of annual landfill gas fugitive emissions. These total fugitive emissions then would need to be compared to the total amount of gas collected to estimate collection efficiency.

Flaw #4 correctly notes that increased surface area will allow more area for fugitive gas to escape. This will be combated with additional gas collection wells in the new expansion area, as required under Federal and State air regulations. However, regardless of where waste is deposited it will be emitting the same amount of gas over time.

Flaw #5 mentions that the 84 odor complaints were "cherry picked" from the hundreds of odor complaints filled out by residents. As mentioned in Section 2.7 of the Modeling Study, Coffin Butte maintains a log of odor complaints received from the public and the Oregon Department of Environmental Quality (DEQ). All odor complaints in this log from 2022 through 2024 were assessed and none were left out. If additional complaints were recorded and not submitted to the Landfill's log, SCS is willing to perform a more expansive analysis if the complaint data can be supplied.

If you have any questions, please contact Jeff Leadford at jleadford@scsengineers.com or 720-272-0172.

TRANSIGHT CONSULTING, LLC
Transportation Engineering and Planning Services

Date:	June 17, 2025
To:	Petra Schuetz
From:	Joe Bessman, PE
Project Reference No.:	1539
Project Name:	Coffin Butte Landfill – VNEQS Response

The purpose of this memorandum is to provide a formal response to comments within the June 10, 2025 memorandum from the Valley Neighbors for Environmental Quality and Safety (VNEQS) related to transportation. These comments were received on the Coffin Butte Landfill conditional use application for expansion south of Coffin Butte Road as part of LU-24-027. Transportation comments within the letter are summarized below and are followed by our response.

Comment 1: The applicant generally assumes that the level of future impacts will be identical to current impacts, when the actual impacts could be double. The annual limit of 1.1 million cubic yards could increase to 1.5 million in years 1-4, and to 1.86 million in years 5-6.

Response: The landfill quantities cited are entirely speculative; within the footnotes of the opposition comments on page 5 it appears that the opponents are mixing changes in total landfill area (acres) with traffic, but these metrics do not correlate. As stated, the transportation study assumed that landfill tonnage would generally follow area population growth, which is projected for the Linn-Benton Counties to remain at about 1 percent annual growth (or less), as documented within the original Transportation Impact Analysis as cited within adopted long-range plans. The traffic study acknowledges that waste levels can vary on an annual basis due to external factors, so in lieu of assessing growth through the approximately seven-year lifespan of the expansion site, accounting for minor trips to the current site, or movement of transfer vehicles between sites, we provided an analysis showing the operational impact of a 50% increase in current (measured and observed) landfill traffic volumes that was reassigned to the system based on the proposed configuration of the scales.

Correlating a 50% trip increase to a tonnage change does not provide a direct conversion for this site; the presence of transfer stations that “intercept” landfill trips results in fewer trips with larger trucks (heavier loads and higher per-vehicle tonnage) from longer distances. Some transfer stations also include solid waste compactors, which can increase tonnage within an equivalent volume. Accordingly, as the site is already a regional landfill that provides trash services for adjacent counties, any increase in tonnage would necessarily occur from longer-distance transport. A 50 percent increase in site trips (which would predominantly consist of larger transfer trucks rather than personal vehicles, dump trailers, or even garbage trucks) equates to more than double the current tonnage and would still provide a very conservative analysis. There are no current plans by Republic Services to increase its operations at the site, but operational fluctuations have occurred historically, and the site is designed to accommodate these levels.

The Benton County Talks Trash ("BCTT Report") Solid Wate Process Workgroup Report, dated April 2023[1], provides historical data historical tonnage information broken out by contributing source. Figure 1 illustrates this trend for the Coffin Butte Landfill. This graphic and accompanying text describe the tonnage increase between 2016 and 2017 as primarily attributable to increased refuse from Washington County in an effort to extend the lifespan of the Riverbend regional landfill. This tonnage was dispersed to other landfills in 2020, resulting in the Coffin Butte tonnage reduction, with this reduction possibly also attributed to the pandemic. The 2021 tonnage increased due to area fires (note that fire and flood intake are exempt from the tonnage cap). Other factors noted by the subcommittee that could influence annual waste tonnage included recession/economic factors, societal changes in waste generation, disposal alternatives, global health issues, environmental legislation changes, and natural disasters.

Chart 3: Intake by Source, 2013 - 2021

	2013	2014	2015	2016	2017	2018	2019	2020	2021

Figure 1. Total tonnage by location (includes daily top cover)

[1]chrome-extension://efaidnbmnnnibpcajpcglclefindmkaj/https://cd.bentoncountyor.gov/wp-content/uploads/2023/12/bctt_final_report_4-11-2023.pdf

The BCTT report also provided information on landfill lifespan. Consistent with the traffic study, this forecast was also premised on a "steady annual tonnage intake of between 1 million and 1.1 million tons for the duration of the landfill's projected remaining site life." (BCTT, pp 618). Accordingly, as the transportation analysis was premised on current conditions plus 50% traffic increases into the landfill (approximately equivalent to doubling the current waste tonnage using transfer stations). This scenario is more conservative than the status-quo assumptions for the Coffin Butte landfill within the BCTT report. Accordingly, no changes to the report are needed to address this comment.

Comment 2: The traffic analysis does not account for the expansion of the landfill to the former quarry site.

Response: The traffic analysis was not prepared to assess use of the former Knife River Quarry site as a landfill; the traffic study was prepared to specifically address the impact of landfill expansion to the south side of Coffin Butte Road as required to support this application. However, the lateral shift in landfill operations has no impact on public streets and is managed entirely within the Republic Services site, so the existing conditions analysis within the report would accurately describe this scenario (and conservatively also includes the Knife River operations that were occurring when the traffic counts were collected). Accordingly, no changes to the report are needed to address this comment.

Comment 3: The old landfill will not disappear; cumulative impacts should be incorporated.

Response: Limited-service trips may occur in the future to service, maintain, and monitor the current landfill site. These values could fluctuate over time and are expected to decrease but will be limited and will not change the findings or results of the analysis. No changes to the analysis were provided in response to this comment as the impacts are likely less than five peak hour trips, and more realistically between zero and two. Accordingly, no changes to the report are needed to address this comment.

Comment 4: The removal of 3.5 million cubic yards to create the new landfill is different than a typical application, with the construction work ongoing for years. This has not been accounted for.

Response: The traffic counts within the traffic study capture the adjacent Knife River rock quarry operations that were being accelerated to support use of adjacent landfill cells. While a specific construction timeline and schedule for construction of the new expansion site are not known at this time, it is expected that creating an adjacent landfill area will provide a similar level of effort as will be the case at the proposed site. As the traffic counts within the traffic study captured this activity (and even increased it by 50%), this on-going construction activity has been accounted for. No changes were provided in response to this comment.

Comment 5: Transporting all the materials from the new landfill site across Coffin Butte Road will require ~270,000 one-way trips in a standard dump truck.

Response: The specific method of hauling material has not been finalized, but it will most likely occur using larger construction vehicles (scrapers or large dump trucks) within a Benton-County approved traffic-control plan. Some of the materials can be used for landfill liners, other material will likely be hauled off-site for fill on other projects. The specific quantities that will remain on-site or hauled to adjacent lands or further off-site are not yet known.

Comment 6: No standard ITE trip generation data is available for landfills, opponents disagree with "non-approved" trip generation approach.

Response: The ITE Trip Generation manual is a useful reference for a broad range of land uses but has limited applicability outside of urban and suburban uses. As most county transportation engineering staff can attest, rural uses tend to be highly variable on a seasonal basis, and travel patterns also vary with the surrounding population served, number of on-site [seasonal and permanent] employees, or material quantities processed. This is the case not just with landfills, but also with quarries, timberyards/operations, farming, and agricultural operations, which have a high variability even between sites within a localized area.

The ITE Trip Generation Manual and its accompanying reference manuals are not silent on how to treat uses that are not directly included, and there are numerous traffic studies of other landfill sites across the US that also provide useful information on landfill operations (as summarized in the traffic report). The ITE Trip Generation Manual directly recommends that engineers collect and obtain local data even for uses that are included in the manual. There is no better comparative site than the existing Coffin Butte landfill, and the data collection at the site over the course of several years, including the recent April 2025 data collection at the Coffin Butte landfill entrance spanning from 7:00 a.m. to 9:00 p.m. provides strong evidence of its current and prior operations and travel characteristics.

Opponent arguments appear to disagree with growth rates applied to the current rates rather than the existing operations of the site, stating that as a regional landfill ("import landfill") trips should correlate to "import area". As previously discussed, and addressed, as waste is transferred from further locations and transfer stations the fleet mix changes, with a lower total volume of higher-capacity trucks transferring an increasing proportion of the tonnage. This substantially reduces the number of trips per ton compared to the use of personal vehicles, dump trailers, or even commercial garbage trucks. This matches the findings of the Twin Creeks Landfill Expansion Report prepared by HDR in 2016 that was referenced within the Traffic Impact Analysis.

Comment 7: The traffic study does not account for cross-traffic on Coffin Butte Road for site preparation activities.

Response: As is common in all traffic studies, the report was prepared to assess operational conditions when the landfill construction is complete. Construction conditions will be less intense on the site than its operation as a landfill, as evidenced by the existing traffic counts at the former Knife River site entrance that demonstrate an accelerated level of activity required to prepare a landfill site. The duration of this "construction period" will be similar to the "existing conditions" included in the report, which are well within Benton County standards. For clarity, this will include the following:

- No change in current travel and access to the Coffin Butte scales
- Similar construction activity as the prior Knife River operations

The traffic study accounts for these characteristics, so no changes are needed to the report.

Comment 8: The traffic study does not account for cross traffic on Coffin Butte Road resulting from traffic design and site preparation. The traffic levels effectively privatize the road and will impede emergency use.

Response: This argument again posits that the site does not account for the preparation of the landfill expansion area, its concurrent use as a landfill, and its suitability to allow emergency ingress/egress while landfill activity doubles.

- Doubling the landfill tonnage at Coffin Butte is not anticipated or planned. The traffic study shows that conservatively increasing the current number of vehicles entering and exiting the landfill by 50% (approximately equivalent to doubling the tonnage) can readily comply with Benton County standards.
- Maintaining use of the existing scales provides an extensive (over quarter-mile) queuing area for vehicles so that back-ups along Coffin Butte Road are avoided. This not only maintains the road clear of blockages for public trips, cyclists, fire and emergency use, but this also simplifies the traffic plan for private users that will not have to modify their haul route.
- The proposal includes reconstruction of Coffin Butte Road within the impacted area, bringing this segment into compliance with Benton County's standards for the roadways freight and collector designations. The voluntary condition to install a new westbound left-turn lane with extensive storage area into the landfill expansion site also prevents queues and back-ups at this new access point.

As provided in the application materials, the levels of traffic on Coffin Butte Road remain well within *Rural Collector* levels, and the elevated volume of trucks associated with a regional landfill (and adjacent quarry site) remain consistent with the *Freight Route* designation of this road. Through travel will continue to occur nearly unimpeded, similar to its current conditions with the new turn lanes.

In terms of the additional "what if" scenarios cited (such as wildfires, earthquakes, etc.) it is noted that these are not included within Benton County's transportation analysis criteria and are addressed in other portions of the application. It should be noted that the transportation improvements presented, and the lack of traffic control for through movements, will continue to enable emergency service providers and the public unrestricted and unimpeded use of Coffin Butte Road. There is no evidence that indicates conditions will in any way impede public or emergency travel along Coffin Butte Road.

Comment 9: Traffic will seriously interfere with uses on adjacent property by impeding traffic flow.

Response: There is no evidence indicating that through traffic will experience any additional delays. With the maintenance of the existing scales that provide extensive on-site queue storage, and the proposed addition of a westbound left-turn lane into the new landfill area, through traffic will continue to flow unimpeded. There is no evidence that indicates conditions will in any way impede public or emergency travel along Coffin Butte Road.

Comment 10: Degradation of Level of Service is an undue burden.

Response: Traffic operations show that conditions will remain well within Benton County standards, which is the only applicable criteria. The opposition's argument that side-street (north-south) delay for vehicles exiting the scales or landfill and turning left or right from a stop sign will provide a public burden is baseless. The minor increase from LOS "A" to LOS "B" only impacts landfill customers/employees. There is no control delay for through motorists on Coffin Butte Road (Level of Service "A"), and no evidence of impacts let along an "undue burden."

Comment 11: Degradation of roadway structural section due to truck traffic creates an "undue burden".

Response: Both Highway 99W and Coffin Butte Road are designated as higher-order streets and as freight routes. The required improvements to Coffin Butte Road will be constructed to an increased standard in recognition of the increased bearing needs of the pavement's structural section. The widening for bicycle lanes also places these heavy vehicles further from the road edge which improves lateral support, reduces

edge stresses and deflections, and avoids pavement edge drop-off. The mitigation provided with this project extends beyond the lifespan of the landfill expansion site.

Comment 12: An undue burden will occur due to road congestion and EMS response to traffic accidents due to increased semi-truck traffic.

Response: There is no evidence that would indicate reconstruction of Coffin Butte Road to Benton County standards, including the voluntary addition of a new westbound left-turn lane and widening for bicycle lanes (shoulders) would increase safety risks. The proposed access point to the new landfill expansion site provides extensive sight lines that comply with AASHTO recommendations. No safety deficiencies were noted in the report or with the preliminary turn lane layout. The presence of trucks on designated freight routes is neither an undue public burden or a public safety issue.

SUMMARY AND CONCLUSIONS

I appreciate the opportunity to provide this supplemental information to help address comments and concerns raised by neighbors and surrounding community members. In addition to these responses, I would further note that ODOT and Benton County transportation engineering staff have also reviewed the transportation materials and agree with the study approach (as provided within the scoping materials), the provided findings, and recommended mitigation measures to address the transportation system impacts. Benton County's findings are provided in the staff report, and ODOT comments have been obtained and also submitted into the record.

As previously stated, the transportation plan has been substantially modified from the prior application to incorporate the public and agency comments and feedback received. The application now avoids impacts to Tampico Road, provides mitigation for its impacts to Coffin Butte Road, retains the unimpeded through function of Coffin Butte Road as a *Collector* and *Freight Route*, and maintains the weigh scales at a location with extensive queuing capacity (over ¼ mile).

If you have any questions I can be reached at joe@transightconsulting.com or at (503) 997-4473.

Geo-Logic ASSOCIATES

Memorandum

To: Jeff Condit **Date:** June 19, 2025

From: John M. Hower, Geo-Logic Associates, Inc.
Eric J. Tuppan, Tuppan Consultants LLC

Subject: Response to comments from Valley Neighbors for Environmental Quality and Safety in response to CUP Application for the expansion of the Coffin Butte Landfill

The following are responses to VNEQS comments received following submittal of the Conditional Use Permit (CUP) application for the Coffin Butte Landfill.

Page 17 - Response to Comments concerning the effect of Development on Dewatering

Valley Landfills, Inc (VLI) previously responded to comments concerned with the effect of the development on the water table and the potential to dewater private water supply wells south of the development. Please refer to page 2 of the June 11, 2025 Memorandum to Jeff Condit prepared by Geo-Logic Associates, Inc. and Tuppan Consultants LLC. VLI's evaluation of the impacts to local water supply wells considers the relative consistency of the groundwater flow conditions to support a conservative assumption that fractured bedrock behaves similarly to a porous media. Under this assumption, all fractures are interconnected, allowing the analytical solution to evaluate the most widespread effect of the proposed project. As stated in the referenced response, the analyses indicated that the change in water levels associated with the proposed development would be similar to changes in water levels associated with seasonal precipitation patterns. VLI will also implement a robust monitoring program and will work with the community to address project-related changes in groundwater availability should those occur. We also note that with adoption of the CUP, VLI will conduct a focused hydrogeologic investigation of the proposed development to confirm and quantify the hydrogeologic conditions in this area of the site.

VNEQS also expressed concern about the effects of the existing landfill operations on outbuilding foundations and a livestock pond northwest of the existing facility. It is unclear how

dewatering would affect concrete foundations, and so without more detail regarding the foundations mentioned in the comment, no appropriate response can be developed.

Page 19 - Response to Comments concerning the adequacy of the Composite Liner System

VLI previously responded to comments concerned with the proposed composite liner system. Please refer to pages 16 and 17 of the June 11, 2025 Memorandum to Jeff Condit prepared by Geo-Logic Associates, Inc. and Tuppan Consultants LLC. As stated in that response, the composite liner system for the proposed development exceeds the current State of Oregon and federal regulatory standards for composite liner system designs for municipal solid waste landfills, and will provide superior protection against groundwater contamination when compared to the prescriptive standard composite liner system design. The designs and construction projects for all previous composite liner systems have been approved by Oregon Department of Environmental Quality (ODEQ), and there has been no evidence of a release to groundwater from portions of the Coffin Butte Landfill equipped with composite liner systems.

Pages 19 through 23 - Response to Comments concerning Groundwater Contamination

Arsenic Concerns

The occurrence of arsenic in groundwater was addressed on pages 4 through 8 of the June 11, 2025 Memorandum to Jeff Condit prepared by Geo-Logic Associates, Inc. and Tuppan Consultants LLC. As demonstrated therein, the occurrence of arsenic in wells MW-9B, MW-26, and MW-27 are attributed to natural background conditions.

PFAS Concerns

The occurrence of PFAS in leachate was addressed on pages 14 and 15 of the June 11, 2025 Memorandum to Jeff Condit prepared by Geo-Logic Associates, Inc. and Tuppan Consultants LLC. VLI notes that current federal, state, and site-specific regulations for landfill environmental monitoring do not require groundwater samples to be analyzed for PFAS. VLI notes that last year, 48.1 percent of the CBL leachate (approximately 23.14 million gallons) was transported from the CBL to the City of Corvallis wastewater treatment facility, accounting for approximately 0.0058 percent of all liquids treated at the wastewater treatment plant last year based on the

City of Corvallis website. As a result, the contribution of PFAS from landfill leachate is expected to be very small.

VNEQS also expressed concern over lack of available PFAS treatment and the potential for PFAS to be discharged into the Willamette River from biosolids. VLI notes that US EPA has identified three commercially-available and widely-utilized treatment technologies that are effective at removing or reducing PFAS in water. These include: granular activated carbon filtration, reverse osmosis filtration, and ion exchange resins. (Source: FACT SHEET: Water Filters). The City of Corvallis uses carbon filtration at its Taylor Water Treatment Plant to remove organic compounds in water, including PFAS.

VLI also notes that the City of Corvallis actively monitors and treats the municipal water supply for PFAS. Importantly, the City has not detected PFAS in drinking water samples. According to the City of Corvallis 2025 Water Quality Report and the City's website, PFAS have not been detected in drinking water (emphasis added):

> *PFAS chemicals are so widely used, they seep into our air, soil, and our water systems. The good news is that PFAS have only been found in a few small public drinking systems in Oregon, and never in Corvallis. Though these chemicals may not originate in waterways (or in water or wastewater treatment facilities) many Oregon clean water utilities, including Corvallis, are taking action to protect public health by:* ***Testing for PFAS in wastewater and wastewater biosolids****; tracking current research on PFAS; working with policy makers to reduce PFAS in consumer products; and informing customers about the latest PFAS news.* ***PFAS and phthalates have not been detected in Corvallis drinking water.***
>
> (Source: https://www.corvallisoregon.gov/publicworks/page/what-are-pfas-and-phthalates)

Domestic Well Contamination Concern

VLI asserts that the statement provided in the "History of Domestic Well Contamination" subsection of VNEQS' comment is inaccurate. At the time that VLI was conducting a remedial investigation for the west side of the landfill in the mid-1990s, their consultants prepared a Preliminary Assessment (EMCON, 1996) for the ODEQ. That report found that no health-based drinking water standards were exceeded in groundwater samples from monitoring wells downgradient of the Closed Landfill or in the Helms well, located southwest of Soap Creek approximately 500 feet from the landfill boundary. Prior to issuance of that report and based upon a recommendation from their consultant, VLI had installed water treatment at the Helms

wellhead, in May 1994, and implemented quarterly monitoring of the domestic well to provide redundant protective measures of the drinking water supply. In addition to these measures, VLI had arranged to purchase the property from Mr. Helms as part of their policy to purchase properties near or adjacent to the landfill. Neither that purchase nor the decommissioning of the well was required by the ODEQ.

At the conclusion of the remedial investigation regulatory process that had been ongoing for the west side of the landfill, VLI submitted a Focused Remedial Investigation and Feasibility Study (Tuppan, 2003) that included recommendations to ensure the protectiveness of the remedy, including decommissioning two unused water supply wells (one of which was the Helms well and the other was an old water supply well for the landfill) and property purchases as buffer around the landfill (the Helms property).

Subsequently, the ODEQ's Staff Report (August 2004) and Record of Decision (October 2005) adopted the recommendation to decommission water wells within areas potentially downgradient of impacts since that measure removes potential exposure to contaminants in groundwater. One of the two wells included the Helms well. That well was decommissioned in September 2006. By that time, the Helms property had already been purchased by VLI.

Domestic Well Impact Concern

As stated on VLI's responses to comments concerning the impacts of blasting and the presence of arsenic at the CBL, VLI is committed to safeguarding the groundwater resources in the communities surrounding the landfill. On pages 4 and 8 of the June 11, 2025 Memorandum to Jeff Condit prepared by Geo-Logic Associates, Inc. and Tuppan Consultants LLC, VLI outlines a groundwater monitoring and response program to address changes in groundwater levels or chemistry that could affect the community.

Willamette Basin Contamination Concern

The CBL is equipped with a robust groundwater monitoring network designed to detect a release from the landfill at the edge of the waste management units, long before potential contamination would leave the landfill property and migrate into the Willamette Basin. This early detection monitoring ability provides space within the landfill property to effectively treat a release before contamination could leave the landfill property and affect the Willamette Basin. The proposed development will add to the existing groundwater monitoring network, and will increase the capability of detecting a release from the landfill.

MEMORANDUM

TO: Republic Services

FROM: James Walsh, P.E., BCEE, SCS Engineers

SUBJECT: Rebuttal to Public Comments Received June 2025
To Benton County Planning & Zoning Commission
On Landfill Fire Potential at Coffin Butte Landfill
From Valley Neighbors for Environmental Quality and Safety

This memorandum is to address various comments submitted by Valley Neighbors for Environmental Quality and Safety (VNEQS) on Coffin Butte Landfill, Pages 27-30, on landfill fire risk. In each case we will repeat the comment verbatim, followed by an SCS rebuttal.

#1: FACTUALLY INCORRECT STATEMENT BY CONSULTANT JAMES WALSH:
"The landfill accepts only MSW (Municipal Solid Waste)"
IN FACT, the facility also accepts "special waste," industrial waste, and C&D (Construction & Demolition) waste. C&D waste is known to be more likely to spontaneously combust.
SCS REBUTTAL: The statement we made above in italics was not meant to be misleading. The characterization of MSW often also includes special waste, industrial waste, and C&D. ODEQ characterizes Coffin Butte as a "municipal solid waste landfill" and that classification is allowed to receive special waste, industrial waste, and C&D. C&D waste in a modern MSW sanitary landfill like Coffin Butte is no more likely to combust than other wastes received. There is no evidence that any approved and accepted waste stream at Coffin Butte Landfill is ever likely to spontaneously combust.

#2. FACTUALLY INCORRECT STATEMENT BY CONSULTANT WALSH:
"The landfill does not accept hazardous waste."
IN FACT, there are no audits of waste, and no penalties for landfilling hazardous waste.
SCS REBUTTAL: The statement we made above in italics is factually correct. Controls on wastes received at Coffin Butte are robust. First, hazardous wastes are tightly regulated by federal and state law at the generator and transport levels. In addition, Republic Services has a rigorous company-wide Waste Acceptance Program that would exclude any hazardous wastes, as well as many other wastes not regulated that Republic views as potentially problematic to the landfill. There are federal and state penalties that apply to generators, transporters, and lastly landfills if any hazardous waste were to slip through to the landfill. Thus, it is very difficult for hazardous waste to reach the Coffin Butte Landfill. In addition, all waste transporters to Coffin Butte Landfill are pre-

registered and their wastes pre-approved by Republic. Lastly, site operators observe waste deposits upon placement at the working face, and any unacceptable wastes are spotted, isolated, and removed.

#3. FACTUALLY INCORRECT STATEMENT BY CONSULTANT WALSH:
"Robust waste approval checks are in place."
IN FACT, there is no oversight of any kind, and when alerted to the presence of hazardous waste in a load, the landfill operator permits disposal of hazardous waste (see Doug Pollock testimony). Any "robust" oversight of disposal would presumably preclude human corpses from being disposed of at the landfill (corpse of Kaylee Birdzell, 2022; remains of Kara Tayler, 2023)
SCS REBUTTAL: The statement we made above in italics is factually correct. Neither ODEQ nor the landfill operator allows regulated hazardous waste to be disposed at Coffin Butte, regardless of the circumstances. Robust waste approvals are in place. See the rebuttal on hazardous and other potentially problematic wastes above. There is additional detailed evidence from Republic in the record elsewhere to support this.

#4. FACTUALLY INCORRECT STATEMENT BY CONSULTANT WALSH:
"Waste disposal is limited to a 1/2 acre working face."
IN FACT, the landfill working face shown on GIS is typically 1.5-2.5 acres (see testimony, Mason Leavitt). More working face = higher fire risk
SCS REBUTTAL: The Applicant addressed this issue in its submission dated June 12, 2025.

#5. FACTUALLY INCORRECT STATEMENT BY CONSULTANT WALSH:
"Daily cover is applied at the close of each business day."
IN FACT, see testimony and photographs, Mark Yeager, and testimony, Roger Orton: daily cover is not consistently applied at the close of each business day. When applied, "alternate daily cover" is often poorly-applied tarps with large gaps that allow for combustion air infiltration.
SCS REBUTTAL: Daily cover is a policy of the landfill. The Applicant will address any occasional departures from this policy. Coffin Butte uses a combination of soil and tarps as daily cover. The use of tarps as an "alternate daily cover" at Coffin Butte has been approved by ODEQ. By definition, approved alternate daily cover is daily cover. There may be some small gaps between tarps. The goal for any daily cover is to cover as much of the daily waste deposits as possible to reduce exposure to atmosphere and oxygen. Tarps as daily cover at Coffin Butte achieve that goal, meeting the state of the practice for the regulated landfill industry, sufficiently reducing the risk of exposure to atmosphere and the risk of fires, to the same extent as soil daily cover.

#6. FACTUALLY INCORRECT STATEMENT BY CONSULTANT WALSH:
"There are three plausible fire scenarios (working face/grassed area/gas well fire."
IN FACT, there are many, many more plausible fire scenarios, including many that would endanger lives and property well beyond the area of the landfill itself:

- PLAUSIBLE SCENARIO 1: a dumped "hot load" (fire burning in the garbage truck, so to minimize truck damage the driver dumps the entire load by the side of the road...a recent

"hot load" dump caused the deadly Sandalwood fire in California that destroyed 70+ structures and resulted in two fatalities);
SCS REBUTTAL: This would be either a working face fire or a grass fire – two of the plausible scenarios already identified. If this were to occur on the landfill property, it would be quickly identified and extinguished.

• PLAUSIBLE SCENARIO 2: Lightning strike (see testimony, Virginia Scott);
SCS REBUTTAL: This would be likely be a grass fire, one of the plausible scenarios.

• PLAUSIBLE SCENARIO 3: Burning embers from a fire burning elsewhere rain down upon the landfill, igniting it. Fire experts tell area residents that this is THE MOST LIKELY scenario for a fire emergency: that a wildfire elsewhere lofts airborne embers into the area, starting fires there;
SCS REBUTTAL: This would likely be a grass fire, one of the plausible scenarios. The likelihood of this is low, and the risk and consequences would be no worse than on any other grassed area in the County. Moreover, the likelihood of timely detection and response is far higher at Coffin Butte Landfill than with other rural and unobserved grassed (or otherwise vegetated) areas.

• PLAUSIBLE SCENARIO 4: Exploding lithium batteries (see testimony, Virginia Scott, & OPB article, "*Exploding lithium batteries are causing fires in Oregon's landfills*");
SCS REBUTTAL: Batteries are excluded from working face disposal and have a designated separate collection area at the landfill. Batteries are not landfilled. If they did get through to the working face, and ignited, they would be manageable as a working face fire, which is already addressed.

• PLAUSIBLE SCENARIO 5: Electrical short ignites fire in garbage truck in the compressed natural gas fueling area (see "Corvallis Fire Instagram account");
SCS REBUTTAL: This has never happened and the likelihood it could is very low. If it did occur, such trucks are isolated on a hard surface, and physically separate from anything else that could ignite. And such a fire would be immediately identified and responded to by on-site staff, who would quickly extinguish the fire.

• PLAUSIBLE SCENARIO 6: "Subsurface Reaction" (the term of art used by the Applicant's fire consultant, Mr. James Walsh to describe spontaneous combustion deep in the landfill mass). In his 2015 expert testimony on the Bridgeton, Missouri fire (we will use the term "fire" rather than "SSR"), the Applicant's fire expert, Mr. Walsh, stated: "There is no known way to prevent the SSR from developing or to stop it." That SSR (or "fire") has now been burning in the Bridgeton landfill for 15 years. There are known risk factors, however, and one of them is having incinerator ash in the landfill; Coffin Butte has been accepting ash from the incinerator in Marion County for years. Another is accepting construction and demolition debris.

SCS REBUTTAL: THE SSR that was identified at Bridgeton Landfill is not a fire. A fire is shallow, aerobic, oxidation, and requires the presence of significant quantities of oxygen. An SSR is deep, anaerobic, lacking oxygen, and assuredly not a fire. An SSR is extremely rare. Plus, temperatures are recorded monthly at all extraction wells at Coffin Butte Landfill, allowing for detection of elevated temperatures in the waste – a way to detect a possible subsurface fire or SSR. All such recorded temperatures to date at Coffin Butte are under the limits prescribed by the MSW landfill NSPS regulations. There is and has been no evidence of an SSR (or underground waste fire) at Coffin Butte and there is no material risk of one developing. Conditions at Bridgeton are entirely different than those at Coffin Butte. Ash alone will not create an SSR.

POTENTIAL CODE CITATIONS – FIRE:

53.215 (1) FIRE SERIOUSLY INTERFERE WITH USES ON ADJACENT PROPERTY

There has been testimony (Erin Bradley & Joel Geier) regarding the threat fire on the landfill posed in 2024 to nearby properties

SCS REBUTTAL FOR THIS COMMENT AND ALL ALLEGED "POTENTIAL CODE VIOLATIONS" BELOW:

This is a list of highly speculative, highly unlikely scenarios. My prior reports, including my June 6, 2025 submission, do not support the outcomes suggested by VNEQS. As an expert in this field, I stand by the conclusion that operations at Coffin Butte, including the proposed expansion, do not present a significant fire risk.

53.215 (1) FIRE SERIOUSLY INTERFERE WITH CHARACTER OF THE AREA

A fire that destroyed structures and forests would result in a significant impact in the character of the area, as can be seen from before/after photographs taken in the aftermath of various Oregon fires in 2020

53.215 (2) FIRE UNDUE BURDEN ON PUBLIC IMPROVEMENTS

A fire that started at the landfill could damage public improvements, including power and water infrastructure.

53.215 (2) FIRE UNDUE BURDEN ON PUBLIC IMPROVEMENTS, EGRESS

If there is an artificial canyon made out of methane-generating garbage on either side of Coffin Butte Road, a fire that started elsewhere and spread to the landfill (via burning embers) could prevent Coffin Butte Road from being a safe egress route for Valley residents

53.215 (1) FIRE UNDUE BURDEN ADAIR FIRE: DANGEROUSLY STEEP SLOPES

The Applicant has told the EPA that the surface of the existing landfill is too steep, and dangerous for EPA personnel to walk over with hand-held air quality monitoring devices. But fire personnel will have to access these same surfaces. Steep and dangerous surfaces are a threat to the life and safety of firefighting personnel and an undue burden.

53.215 (1) FIRE UNDUE BURDEN ADAIR FIRE: ADDITIONAL 59 ACRES OF SURFACE ON WHICH FIRES MIGHT IGNITE

The increase in the landfill surface area is 145% of existing landfill footprint, without taking slopes into account (like the roof of a building, the surface area of the landfill is greater than its footprint). An increased surface area of 45% is a material amount and poses a threat to the life and safety of firefighting personnel and an undue burden.

53.215 (1) FIRE UNDUE BURDEN ADAIR FIRE: ADDITIONAL 10,000,000 CUYD OF METHANE-GENERATING WASTE IN PLACE

The proposal will increase waste in place by 140% over existing waste-in-place. More waste-in-place means more methane. Methane is currently being released as fugitive emissions from the landfill in explosive concentrations. An increased amount of 40% is a material amount of explosive methane and is a threat to the life and safety of firefighting personnel and an undue burden

53.215 (1) FIRE UNDUE BURDEN ADAIR FIRE: GEOMETRY OF THE PROPOSAL

The proposal will create an artificial canyon made of garbage on either side of Coffin Butte Road, each side of which will producing methane at explosive levels. The new topography will intensify fires moving uphill and increase wind speed if a fire ignites on either side of the artificial canyon. Fighting fires in an artificial canyon made of methane-producing garbage is a threat to the life and safety of firefighting personnel and an undue burden.

53.215 (1) FIRE UNDUE BURDEN CORVALLIS & BENTON COUNTY RFD's

Hot loads could be dumped by the side of any road in Benton County where there is garbage truck traffic to the landfill. Therefore, a fire like the deadly Sandalwood fire could ignite anywhere and could pose an undue burden to firefighting personnel.

53.215 (1) LANDFILL NOT CONSIDERED IN COMMUNITY WILDFIRE PROTECTION PLAN – UNDUE BURDEN ON BENTON COUNTY COMMUNITY DEVELOPMENT STAFF

Benton County staff did not incorporate the landfill in the CWPP. The reason given was inadequate experience and that it was "a task too large to undertake" by Benton County staff.[21]

[21] Email, Inga Williams to Nancy Whitcombe, 3/18/2022 "I don't see how I can include this in CWPP as I have no experience in the topic and it would be a task too large to undertake for what is in the final dra stages. It may be that it could be included as a task to be worked on in future year updates."

53.215 (1) FIRE UNDUE BURDEN – PROPERTIES IN THE LANDFILL AREA

Hot loads are most likely to be dumped on roadsides in the landfill area. In fact, in the early 2000's a "hot load" was dumped north of the landfill. Therefore, a fire like the deadly Sandalwood fire could ignite in that area and pose an undue burden of fire risk
to residents and their properties.

53.215 (1) FEMA DOCUMENT ON LANDFILL FIRES

The FEMA document "LANDFILL FIRES THEIR MAGNITUDE, CHARACTERISTICS, AND MITIGATION" states:

> *"Landfill fires are particularly challenging to the fire service. A large landfill fire normally requires numerous personnel and a significant period of time before it is contained. Both of these circumstances can strain a jurisdiction, particularly one dependent on volunteer staffing."*

So, per FEMA, a large landfill fire would particularly strain Adair RFD. This document continues, regarding Mr. Walsh's recommendation of water tanker mitigation:

> *"The use of water to suppress landfill fires is controversial. The application of large volumes of water may actually exacerbate a fire by contributing to the process of aerobic decomposition*."

It goes on in some detail about underground fires that can begin via spontaneous combustion. Applicant's consultant, Mr. James Walsh, failed to mention such fires as a 'plausible fire scenario' for Coffin Butte. However, regarding the Bridgeton landfill fire, Mr. Walsh opined that there was 'no known way' to prevent that type of landfill fire or to stop it. Per FEMA:

> *"Fires, particularly those underground, can undermine the integrity of the landfill, which could cause a collapse under the weight of landfill employees, firefighters, or equipment."*[22]

[22] FEMA, all quotes from "LANDFILL FIRES [etc]" pages 1, 15, 16

SCS REBUTTAL: We are well familiar with the FEMA document cited. FEMA often creates large debris piles from disaster cleanups. Waste in those can be left uncovered for months. Understandably, FEMA has had issues with fires in those large uncovered debris piles. However, FEMA has no operating experience with a modern MSW sanitary landfill like Coffin Butte Landfill, much less its fire potential or reality. Like any modern MSW landfill, Coffin Butte Landfill covers its waste each night, and never has large areas of uncovered waste exposed for months at a time. Coffin Butte has far less fire potential than that reported and experienced by FEMA. The fires that can and have occurred at Coffin Butte are much smaller than what FEMA has experienced with large completely uncovered debris piles.

We previously addressed support from Adair Fire in the SCS rebuttals of June 6, 2025. Coffin Butte and Adair Fire had a meeting in March 2025 to discuss and plan to work together when needed going forward. At that time, Adair Fire indicated they looked forward to continuing support to the landfill. The landfill appreciates that support, when needed. It should be noted that most fires are handled by on-site staff and Adair Fire's support is not needed. When Adair Fire has responded, their support, combined with the current on-site capabilities of Coffin Butte Landfill, has proved plenty sufficient to quickly extinguish the fire.

As to underground fires threatening the surface integrity of the landfill and endangering fire fighters, such large fires at depth simply do not occur at a modern sanitary landfill. Spontaneous combustion and fire spread can not occur at depth in such a landfill. Unlike debris piles, the underground waste in a modern MSW sanitary landfill is well compacted and very dense. It is infeasible to have sufficient oxygen to create or expand an underground landfill fire at Coffin Butte

Landfill. With that, the surface integrity of any modern MSW sanitary landfill like Coffin Butte is not threatened.

Lastly, we would agree the use of water to extinguish large landfill fires is not desirable. Water should be primary for grass fires only. We cited soil as primary for both working face fires and gas extraction well fires, as is standard practice among modern MSW sanitary landfills. The size of a fire at depth in Coffin Butte Landfill as is suggested here is simply not plausible for the above reasons.

Wildlife Memorandum

for Coffin Butte Landfill Expansion Project

For: Jeff Shepherd, P.E. – Civil & Environmental Consultants, Inc.

By: Stephanie James, M.S. – Turnstone Environmental Consultants, Inc.

Date: June 19, 2025

INTRODUCTION

This memorandum is to address questions and comments raised by the Valley Neighbors for Environmental Quality and Safety related to wildlife.

COMMUNITY ADDRESSES FLAWS IN THE APPLICANT'S CONSULTANT'S STUDY – WILDLIFE:

The Applicant's proposal relies on moving current landfill accessory uses that are accommodated on the 59-acre LS-zoned (*Landfill Site zoned*) parcel onto parcels zoned FC (*Forest Conservation*). The reason that the LS zone was created in 1983 was to prevent FC parcels from being used for landfill operations. Forest Conservation is for conserving forests, not destroying them, which is what the Applicant proposes to do. The language of the FC zone is that its purpose is to "…conserve forest lands…and protect the…wildlife resources in the zone." With regard to the impact of blasting away the mountainside, filling it with garbage, and displacing current landfill operations equipment onto non-LS-zoned parcels, the proposal would have the following impacts:

BLUE HERONS 1: EXPANDED DISTURBANCE FROM EXPANDED OPERATIONS WOULD PUT THE HERON COLONY AT RISK Blue Herons have been observed continuing to use trees on the Forest Conservation parcel as perches, while nesting immediately across the highway from the proposed new leachate ponds. Herons have been known to recolonize temporarily abandoned nesting trees, and might do so here if the source of disturbance goes away. But if human activity, large-scale removal of forestlands, earth-moving, and location of leachate ponds and haul roads cause continued disruption, including on the Forest Conservation parcel closer to the currently active nests, collapse of the colony and permanent abandonment could result.

Response: The Great Blue Heron protected site ("east rookery") has expanded to the area east of HWY-99W. The expanded operations in the Forest Conservation zone would be located in close proximity to the abandoned stick nests in the hybrid poplar stand but outside of the 300-foot buffer. The individual birds in this rookery are likely inured to the existing infrastructure which includes a gas management facility and HWY-99W, which now bisects the expanded protected site. The new facilities, including the proposed scale house, maintenance building, and leachate loadout area would be located south and west of the east rookery, adequately buffered by 300 feet of forest, and situated on the opposite side of the highway from the active nesting site. Recolonization of the exposed, monoculture hybrid poplar forest stand may not provide a benefit to the population as they appear have greater reproductive success in their new location.

BLUE HERONS 2: EXPOSING BLUE HERONS TO DISEASE An active landfill adjacent to their continuing rookery will increase the number and diverse bird species that can result in the spread of various avian diseases. The bird flu virus can survive up to two years in a landfill, so carcasses of infected birds disposed of in landfills can disseminate avian flu, endangering the surviving population of Blue Herons.

Response: The Animal and Plant Health Inspection Service (APHIS) of the U.S. Department of Agriculture recommends double-bagging and disposing of the carcass of a bird infected with the highly pathogenic avian influenza ("avian flu") in your regular trash. Expanding the landfill would not likely increase the number of infected carcasses that arrive at the landfill or increase the exposure of infected carcasses to the local Great Blue Heron or other local bird populations.

BALD EAGLES 1: DESTRUCTION OF HABITAT The applicant's wildlife consultant has observed bald eagles foraging and soaring on the 59-acre parcel. An active landfill on this parcel will provide scavenging opportunities that can induce them to ingest harmful garbage.

Response: The landfill expansion would not likely increase the exposure of bald eagles to infected harmful garbage, as the number of active cells would not increase.

BALD EAGLES 2: EXPOSING BALD EAGLES TO DISEASE An active landfill damages bald eagles by concentrating great numbers of invasive bird species such as starlings as well as providing infected bird carcasses (culled domestic birds) that can result in the spread of avian disease.

Response: As with potential increased risk to the Great Blue Heron, the landfill expansion would not likely increase the exposure of bald eagles to the avian flu. The amount of incoming infected bird carcasses is not likely to increase due to landfill expansion and the rate of exposure is not likely to increase due to landfill expansion.

OTHER WILDLIFE: DEER, ELK, BOBCAT, COUGAR, RACOON, STRIPED SKUNK Community members agree with the applicant's consultants; the parcels are important habitat. Per the purpose of the zone, this habitat should be conserved, not destroyed.

Response: The Oregon Department of Fish and Wildlife (ODFW) classified the E.E. Wilson Wildlife Area as Impacted Habitat for resident and migratory deer and elk populations. Impacted Habitat is where deer and elk are considered in conflict with primary land uses and are "subject to anthropogenic development such as areas within urban growth boundaries, city limits, otherwise determined to be less suitable habitat for deer or elk because of conflicts with proximity to humans, disease, damage, or public nuisance resulting from use by local or resident deer or elk". The habitat in the FC zone is non-essential habitat situated between landfill operations and a busy HWY-99W. There is important habitat with higher functions and greater value located farther away from the landfill, away from the facilities, and away from the highway.

53.215 (1) WILDLIFE HABITAT SERIOUSLY INTERFERE: BLUE HERON WILL NOT RECOLONIZE

This location is very advantageous to nesting Blue Herons, with close access both to wetlands to the east and farm fields to the west. Removing the west rookery conifers in the perhaps abandoned west rookery will prevent the Blue Herons that are currently nesting adjacent to the site from ever recolonizing them. Disturbance near the east rookery poplars will also prevent the herons from recolonizing those trees.

Response: Many neighbors have noted observing the east rookery in the exposed hybrid poplar trees prior to the nest abandonment in the middle of the 2022 breeding period. The deciduous nature of this monoculture stand does not provide great cover in the late winter and early spring when the Great Blue Heron is in the nest building, egg laying, and incubating periods. The new rookery location is in a mixed conifer/deciduous stand farther from landfill current operations, on

the E. E. Wilson Wildlife Area, which is likely a location that will provide greater long-term survival. Recolonization of the exposed hybrid poplar stand may lead to future colony collapses and is not necessarily beneficial to the population.

53.215 (1) WILDLIFE HABITAT SERIOUSLY INTERFERE: BLUE HERONS INCOMPATIBLE WITH LANDFILL ACTIVITIES

The Applicant since LU 21-047, has demonstrated that landfill operations are not compatible with Blue Heron habitat by causing rookery abandonment. Moving landfill operations even closer to the Blue Heron's new habitat is likely to drive them away from that as well.

Response: The location of the proposed new facilities is greater than 300 feet from the new and old east rookery nest trees and buffered by mature trees and HWY-99W.

53.215 (1) WILDLIFE HABITAT USES ON ADJACENT PROPERTY: DISEASE

Placing municipal solid waste on the 59-acre parcel will expose BLUE HERONS, BALD EAGLES and RED-TAILED HAWKS to avian disease, both via the ingestion of infected bird carcasses and through mingling with large numbers of diverse bird species that congregate at a landfill

Response: The landfill expansion would not significantly increase the exposure of local bird populations to the avian flu. Even if the surface area of operations increases, there would still be the same amount of infected carcasses arriving at the landfill.

53.215 (2) THE LANDFILL IS "SPOT ZONING" IN A FORESTED AREA OVERWHELMINGLY DEDICATED TO THE PROTECTION OF WILDLIFE. REPLACING THE FOREST WITH A PILE OF GARBAGE WOULD SERIOUSLY INTERFERE WITH THE OVERALL CHARACTER OF THE AREA

The current landfill area is less than 180 acres. Directly across Highway 99 is an 1800-acre wildlife preserve. The character of the area south of Coffin Bute Road – forested gentle slopes that Applicant acknowledges is an important wildlife habitat -- has more in common with the larger wildlife preserve to the east than the relatively small landfill to the north. “Purpose of Conservation Zone The applicant has not met the burden of proof that the proposal will not interfere with the purpose of the Forest Conservation zone for protection of the wildlife resources.”

Response: Reference to 53.215 (2) which states the “proposed use does not impose an undue burden on any public improvements, facilities, utilities, or services available to the area” is likely in error. This is non-essential habitat, important but not essential. There is habitat with greater importance, with higher functions, greater values, that is located farther away from the landfill, away from the facilities, and away from the highway.

Sincerely,

Stephanie James
